# Development of Fuel Cell Vehicles

	Prototype Vehicle	Demonstration Vehicle	Low Volume Production Vehicle	High Volume Production Vehicle
<b>Number of Vehicles</b>	≤ 10s	~100s	~1000s	~10,000 - 100,000
<b>Challenge</b>	<u>Learning vehicles:</u> <ul style="list-style-type: none"> <li>• improve operation</li> <li>• experience fueling</li> <li>• improve reliability</li> </ul>	<u>Demo vehicles:</u> <ul style="list-style-type: none"> <li>• monitor operation</li> <li>• refine fueling</li> <li>• improve durability &amp; efficiency &amp; cost</li> <li>• establish repair/maintenance</li> <li>• feedback vehicle operation &amp; driver experience</li> </ul>	<u>Initial production:</u> <ul style="list-style-type: none"> <li>• verify reliability, efficiency durability, cost</li> <li>• expand fueling infrastructure</li> <li>• monitor driver experience</li> <li>• feedback to next generation</li> </ul>	
<b>Public Standards &amp; Regulations</b>	<u>Develop best practices</u> <ul style="list-style-type: none"> <li>-- product design</li> <li>-- product efficiency testing</li> <li>-- product safety testing</li> <li>-- refueling interface</li> </ul>	<u>Refine public standards</u> <ul style="list-style-type: none"> <li>-- fueling interface</li> <li>-- safety</li> <li>-- energy efficiency</li> </ul>		
<b>Government Role</b>	<ul style="list-style-type: none"> <li>• Support basic research</li> <li>• Support technology development</li> </ul>	<u>Support deployment</u> (vehicles & infrastructure) deployment to monitor readiness, efficiency & cost	<u>Develop regulations</u> <ul style="list-style-type: none"> <li>-- safety</li> <li>-- emissions</li> </ul>	

# Considerations in Development of Standards / Regulations

## ❖ Performance-based versus Prescriptive

### • Performance-based:

- demonstrate capability to perform under on-road conditions
- demonstrate safe performance under extreme conditions
- rapid technology advancement

### • Prescriptive:

- test for known failure modes of earlier technologies
- project performance under extreme conditions
- delayed technology advancement

Vehicle Crash Tests  
are an example of  
Performance-Based  
Design Qualification  
Tests

## ❖ Design guidelines versus Safety Design Qualification (Verification) Requirements

### • Design Guidelines

For use by engineers developing storage systems

Guidelines capture safety issues to be considered, FMEA, root cause analysis, environmental factors, safety strategy, material properties and test methods, analysis and simulation tools, performance requirements

### • Design Qualification

For use by engineers providing final safety qualification testing

Test methods capture on-road extreme demand profiles in test conditions

Verify safety in a vehicle context

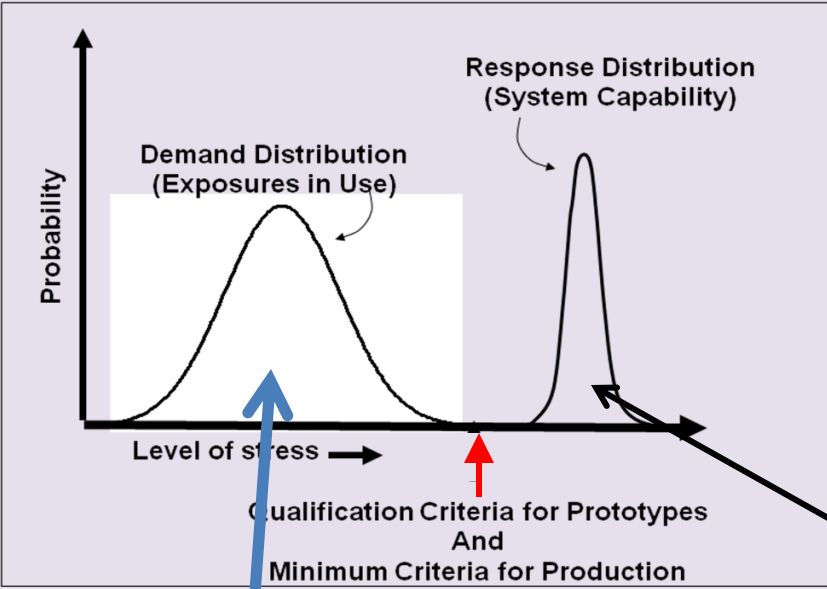

# Compressed Hydrogen Storage System

Closures:

- TPRD = thermally activated pressure relief device
- Check valve – prevents reverse flow in fueling line
- Shut-off Valve – automatic fail-safe closure valve

# ❖ On-road extreme demand profiles

## Worst-Case On-Road Conditions for Storage

- 5500 cycles, -40C, +85C, 125%NWP & 150%NWP
- 25 years at NWP (Parking )
- In-use impacts (scratches & abrasions)
- Exposure to chemicals & impacts
- Localized & engulfing fire

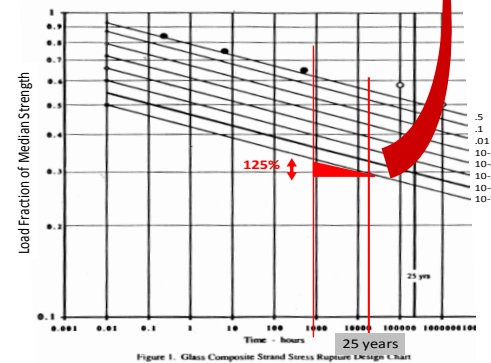

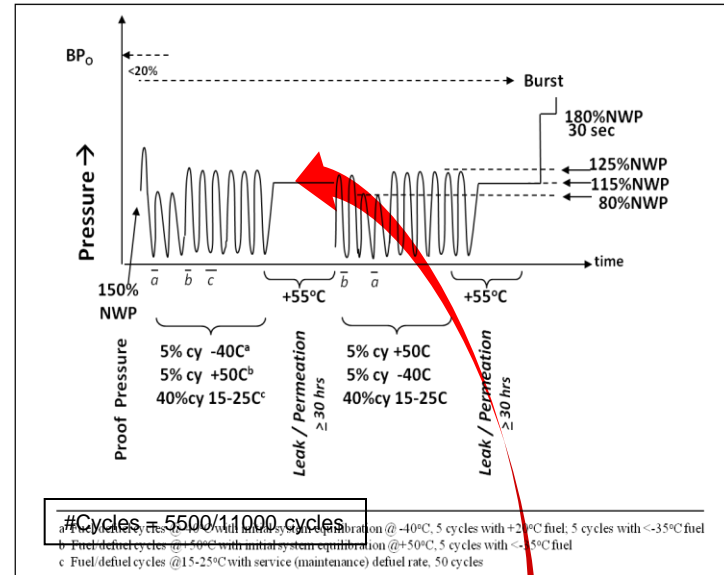

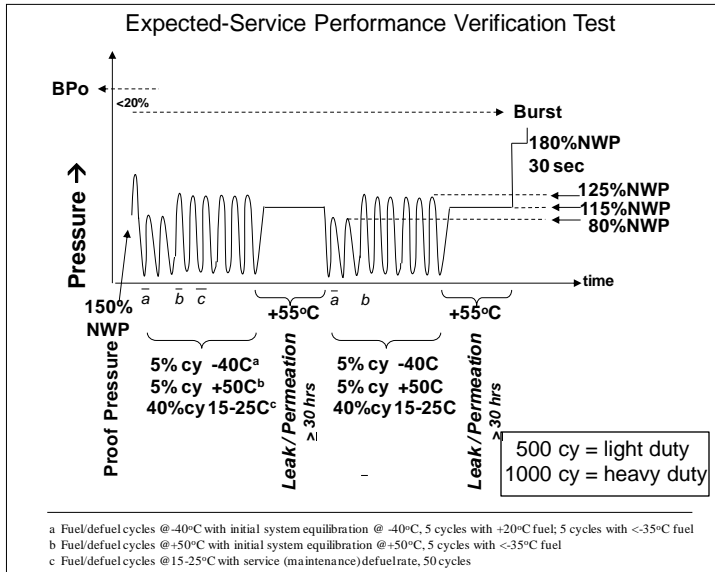

**Worst-Case Conditions = Test Conditions**

- Demands:**
- Number of fueling/de-fueling pressure cycles
  - Duration of sustained pressure
  - Exposure to ambient temperature extremes
  - Exposure to chemicals (acids, bases, solvents)
  - Exposure to over-pressurizations (fueling station failures)

- Responses:**
- Full function through life
  - No leak in service or crash
  - No rupture
  - Release in fire

# 1. Pneumatic sequence (H<sub>2</sub> gas is fluid)

# 2. Hydraulic sequence (liquid is fluid)

# 3. Fire Test

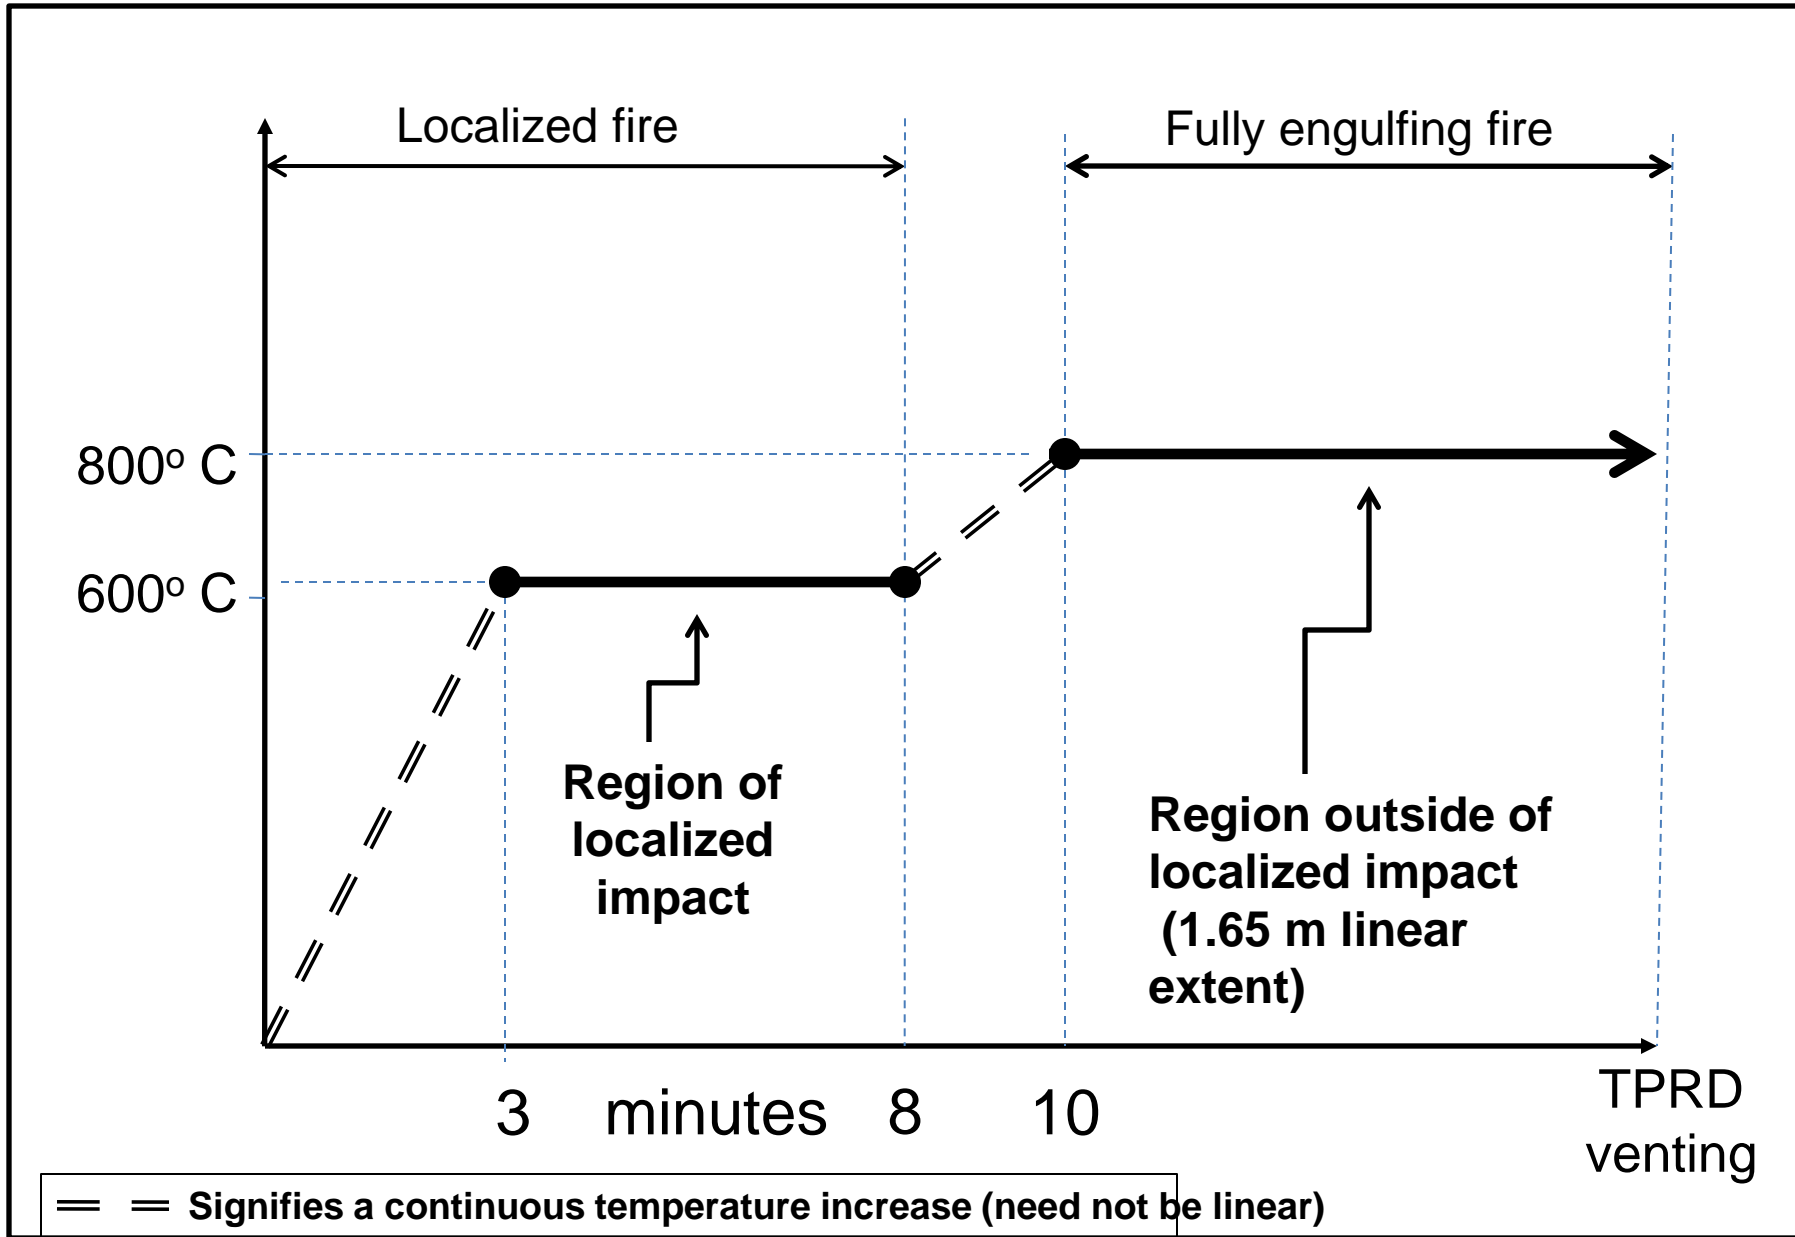

# 4. Control of Production Variability

- 3 vessels tested in design qualification -- Leak-Before-Burst
- 3 vessels tested in design qualification -- burst pressure ± 10%
- periodic (batch) testing during production

Open Issues  
in  
Development of the Safety Design Qualification Requirements  
For Compressed Hydrogen Storage

-  Fire test – localized fire test  
-- engulfing fire test
- Hydrogen embrittlement

# Proposed Localized Fire Design Qualification Test

Open Issues  
in  
Development of the Safety Design Qualification Requirements  
For Compressed Hydrogen Storage

- Fire test – localized fire test  
-- engulfing fire test
-  • Hydrogen embrittlement

# Material Compatibility for High Pressure Hydrogen (Embrittlement Resistance)

## ➔ ❖ unrestricted (all tank designs) qualification

- **Accepted Steel alloys:**

UNS# S31603 (equivalents include SUS316L, AISI316L, AISI316 and DIN1.4435); all must have  $\geq$  12% nickel composition and  $\leq$  0.1% magnetic phases by volume.

No welds

- **Accepted Aluminum alloys:**

A6061-T6, A6061-T62, A6061-T651 and A6061-T6511.

No welds

- **Acceptance of additional alloys:**

1. Slow Strain Rate Test

2. Fatigue Life Test

3. Fatigue Crack Growth Test

OR

## ➔ ❖ design-restricted qualification

5500 125%NWP cycles with H<sub>2</sub>, no leak; 11000 cycles, no rupture; hydraulic qualification modified for H<sub>2</sub> crack acceleration
