

Outline

- Describe some of the programs and studies the USGS does at the Idaho National Laboratory.
- Describe the Groundwater Measurement and Sampling Program.
- Present some of our recent findings from wells with pumps in them.
- Describe our groundwater sampling using multilevel monitoring wells.
- Present some findings from the multilevel wells
- Present some findings from our groundwater flow model studies.
- Wrap up with how our studies are useful for the Idaho Cleanup Project.

USGS INL Programs

- *Hydrologic monitoring*
- *Streamflow monitoring*
- *Core and well drilling*
- *Geophysical logging*
- *Core library*
- *Geologic framework*
- *Geochemistry*
- *Hydraulic properties*
- *Groundwater flow and contaminant-transport modeling*

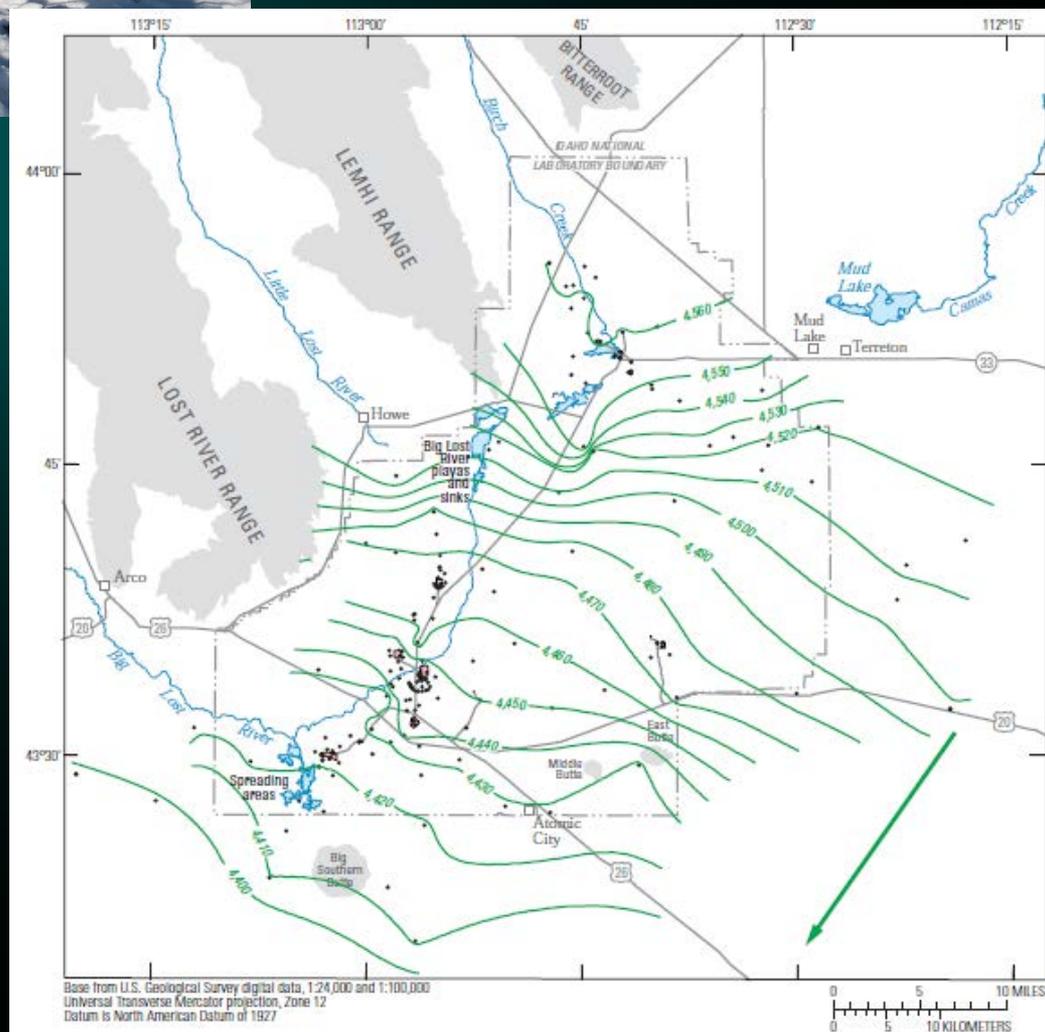

Water-level Monitoring

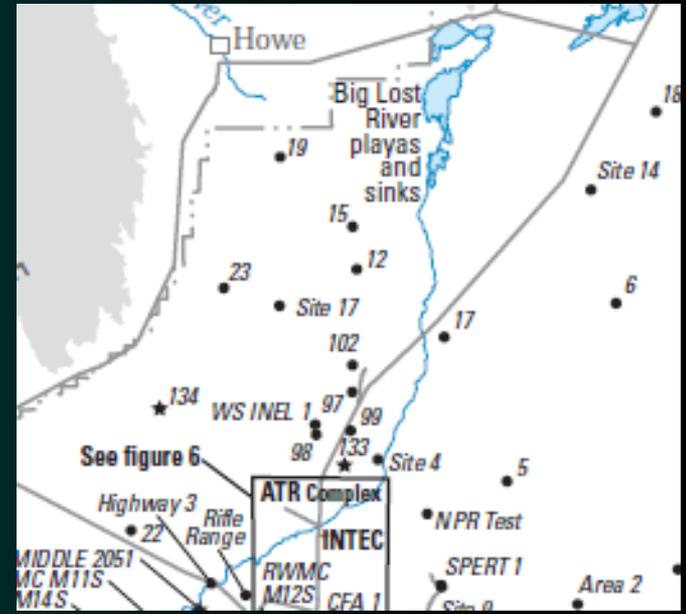

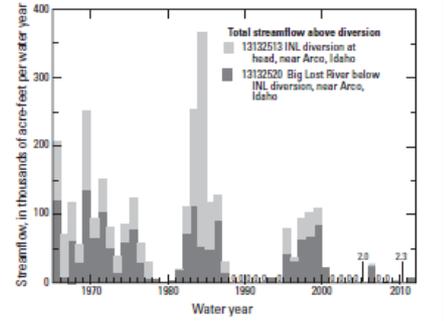

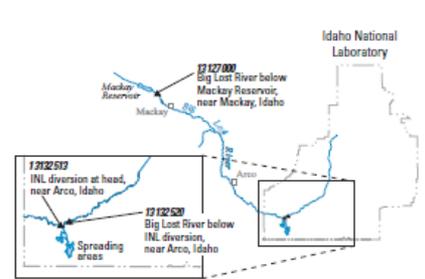

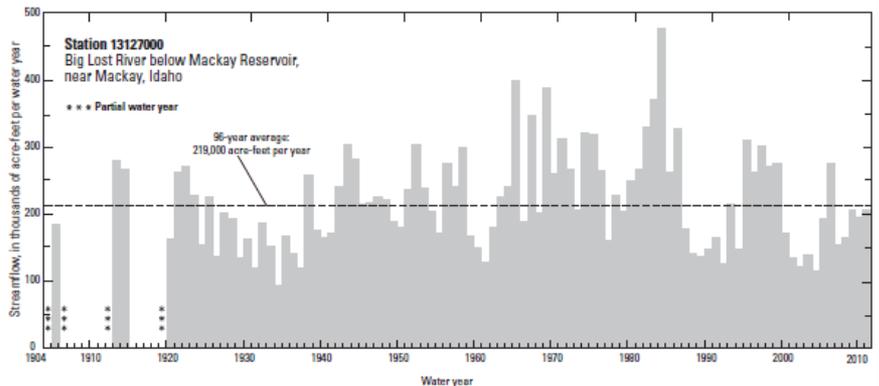

Water levels – monthly to annually at about 205 wells (5 continuous recorders-2 real-time)

Measurements needed for water availability and model re-calibration

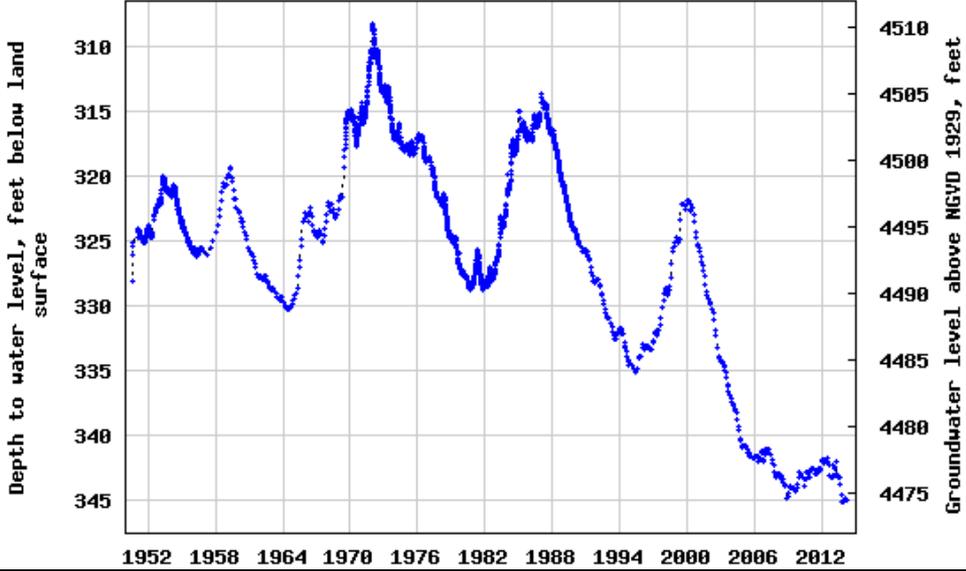

Water levels are cyclical, but are trending downwards. Some wells are going dry

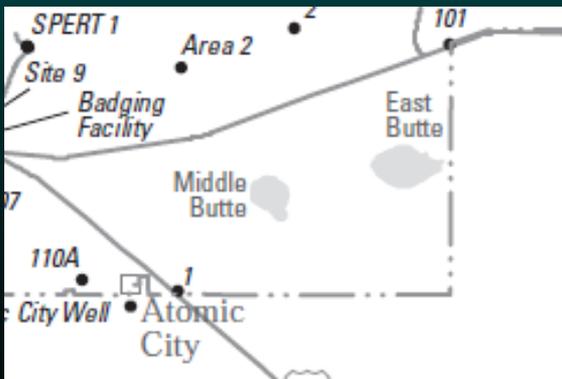

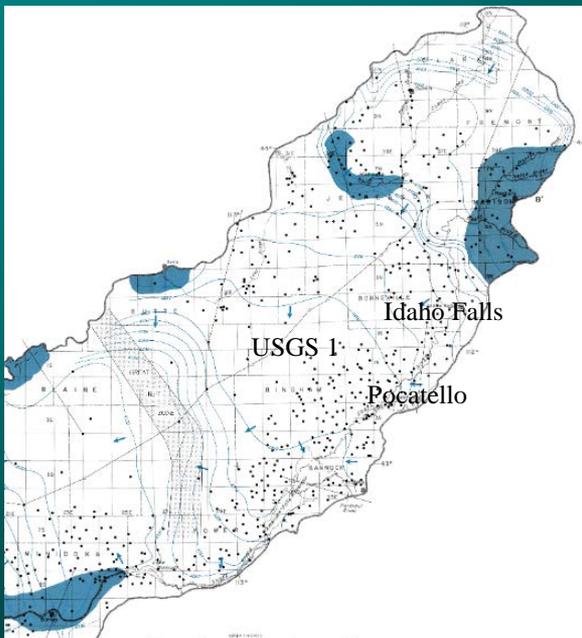

USGS 434126112550701 04N 30E 07ADB1

USGS 12

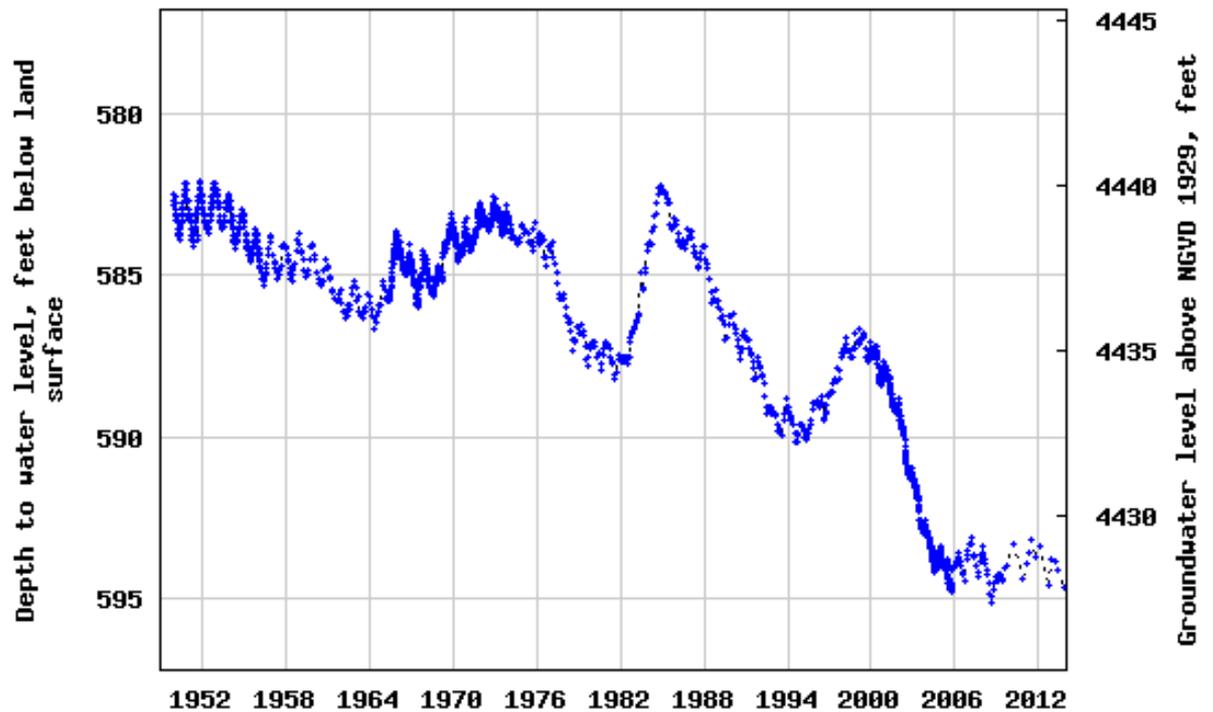

USGS Waterwatch well completed in basalt

USGS 432700112470801 02N 31E 35DCC1

USGS 1

----- Provisional Data Subject to Revision -----

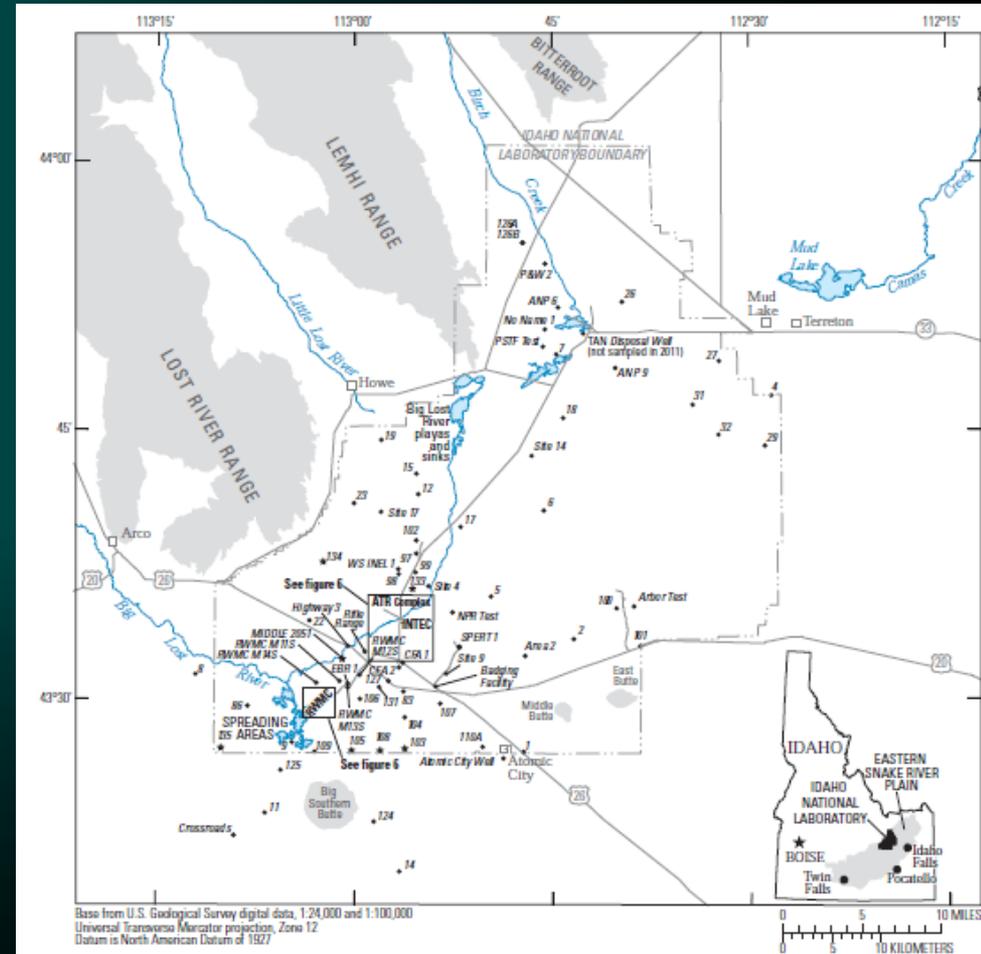

Water Sample Monitoring

Water quality – annually at 150 sites

Sample all sites for tritium and chloride

Selected sites for sulfate, sodium, fluoride, chromium, Sr-90, Pu, Am, alpha, beta, gamma, VOC's, suite of trace elements; periodic I-129

EXPLANATION

- ★ Well equipped with multilevel monitoring system
- Inset areas for selected facilities at the Idaho National Laboratory—See figure 6.
- Well in the USGS aquifer water-quality monitoring network and identifier
 RWMC M14S 14
- Local well identifier—Number only shows USGS well, other names are local well names
- Frequency of water-sample collections—All wells sampled annually
- RWMC Radioactive Waste Management Complex
- ATR Complex Advanced Test Reactor Complex
- INTEC Idaho Nuclear Technology and Engineering Center
- TAN Test Area North

Figure 5. Location of wells in the U.S. Geological Survey aquifer water-quality monitoring network, Idaho National Laboratory and vicinity, Idaho, as of December 2011.

DOE/ID-22225

Prepared in cooperation with the U.S. Department of Energy

Iodine-129 in the Eastern Snake River Plain Aquifer at and near the Idaho National Laboratory, Idaho, 2010–12

Scientific Investigations Report 2013–5195

U.S. Department of the Interior
U.S. Geological Survey

DOE/ID-22226

Prepared in cooperation with the U.S. Department of Energy

An Update of Hydrologic Conditions and Distribution of Selected Constituents in Water, Eastern Snake River Plain Aquifer and Perched Groundwater Zones, Idaho National Laboratory, Idaho, Emphasis 2009–11

Scientific Investigations Report 2013–5214

U.S. Department of the Interior
U.S. Geological Survey

Tritium

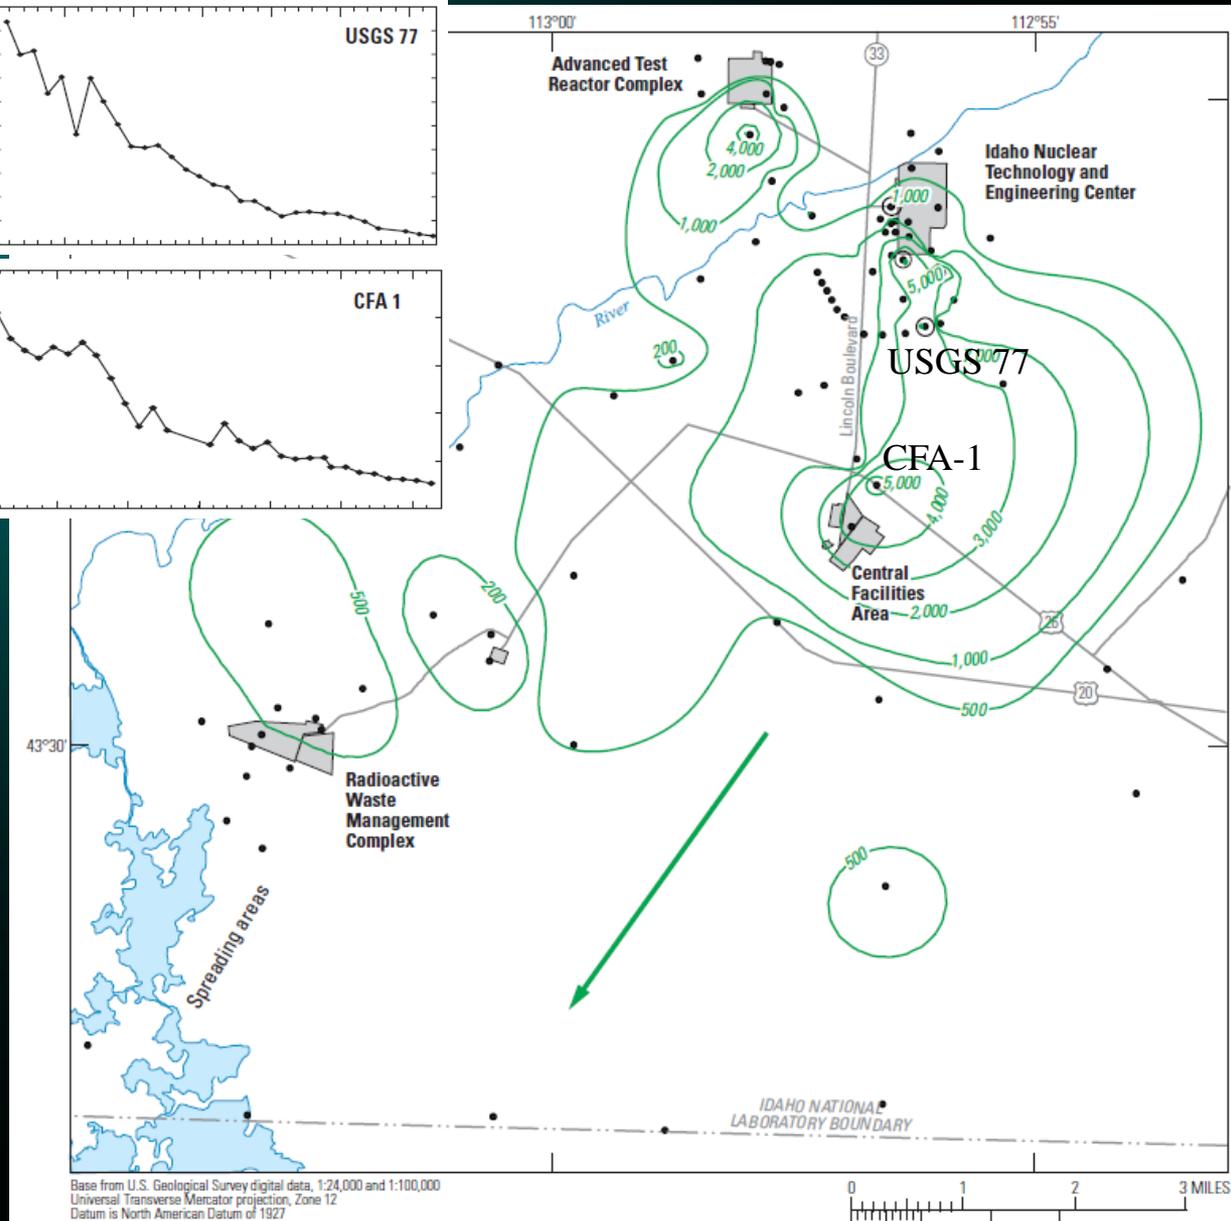

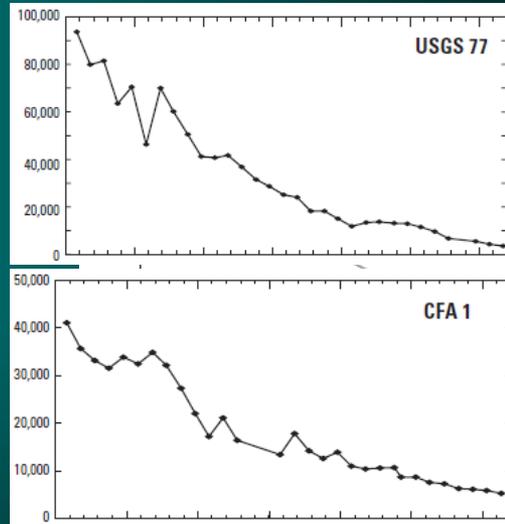

Drinking water standard is 20,000 pCi/L

Has a radioactive half life of 12.3 years.

Have not had concentrations above the drinking water standard since 1997

Our laboratory detection level is about 200 pCi/L

Background from non-INL activities is thought to be below 150 pCi/L

Base from U.S. Geological Survey digital data, 1:24,000 and 1:100,000
Universal Transverse Mercator projection, Zone 12
Datum is North American Datum of 1927

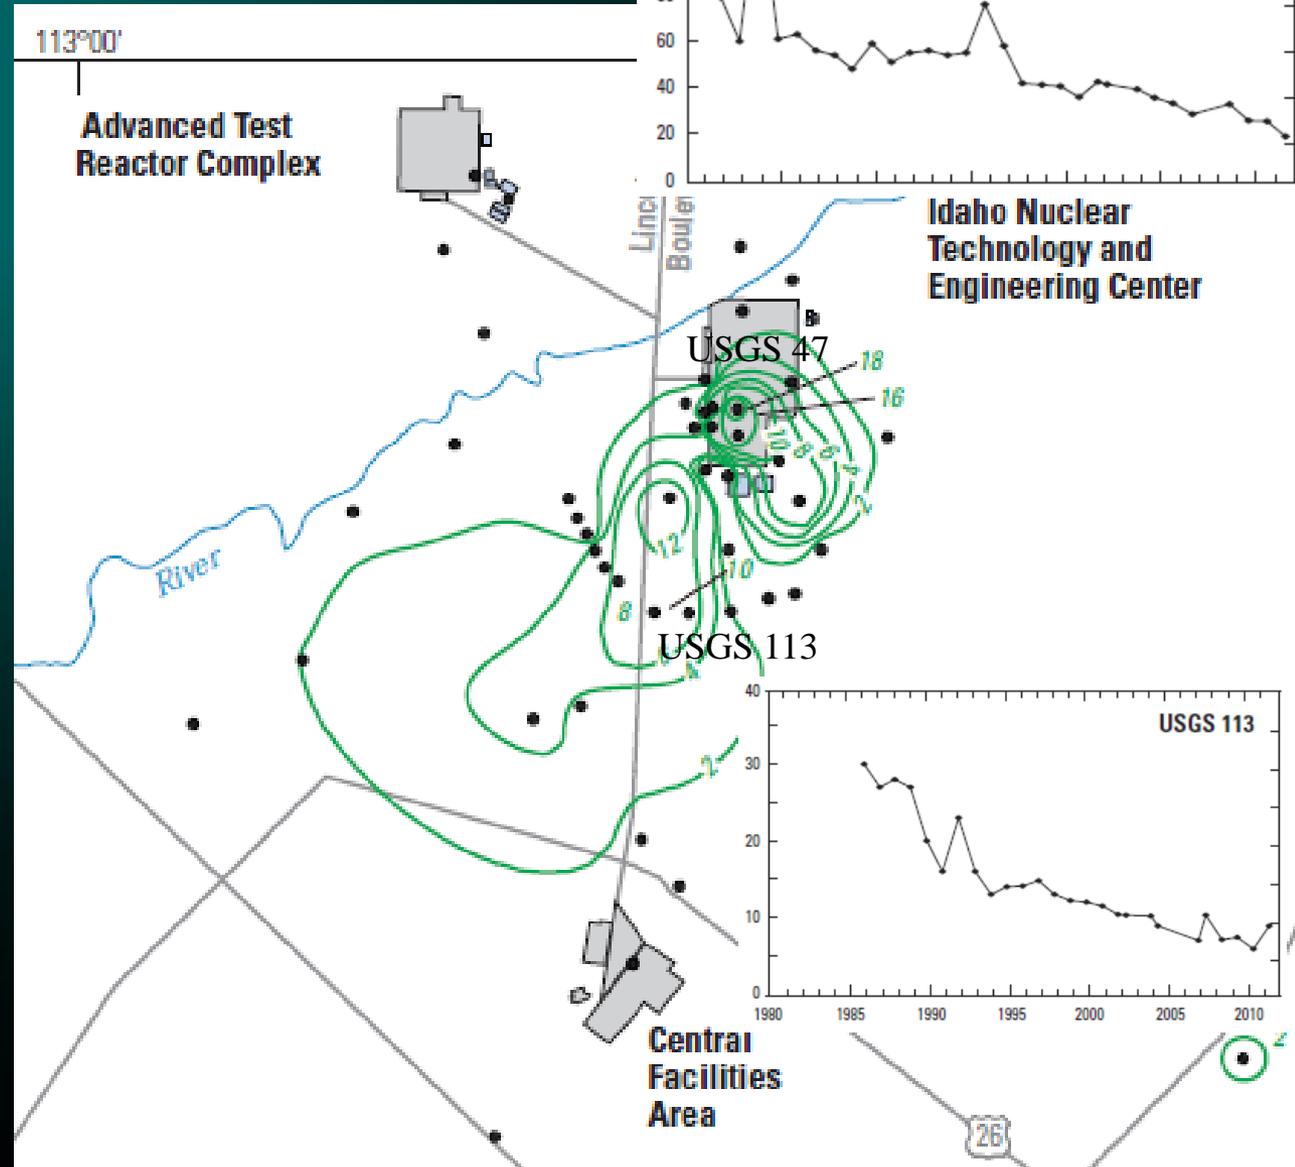

Strontium-90

Drinking water standard is 8 pCi/L

Has a radioactive half life of 29.1 years.

Still have several wells with concentrations above the drinking water standard.

Our laboratory detection level is about 2 pCi/L

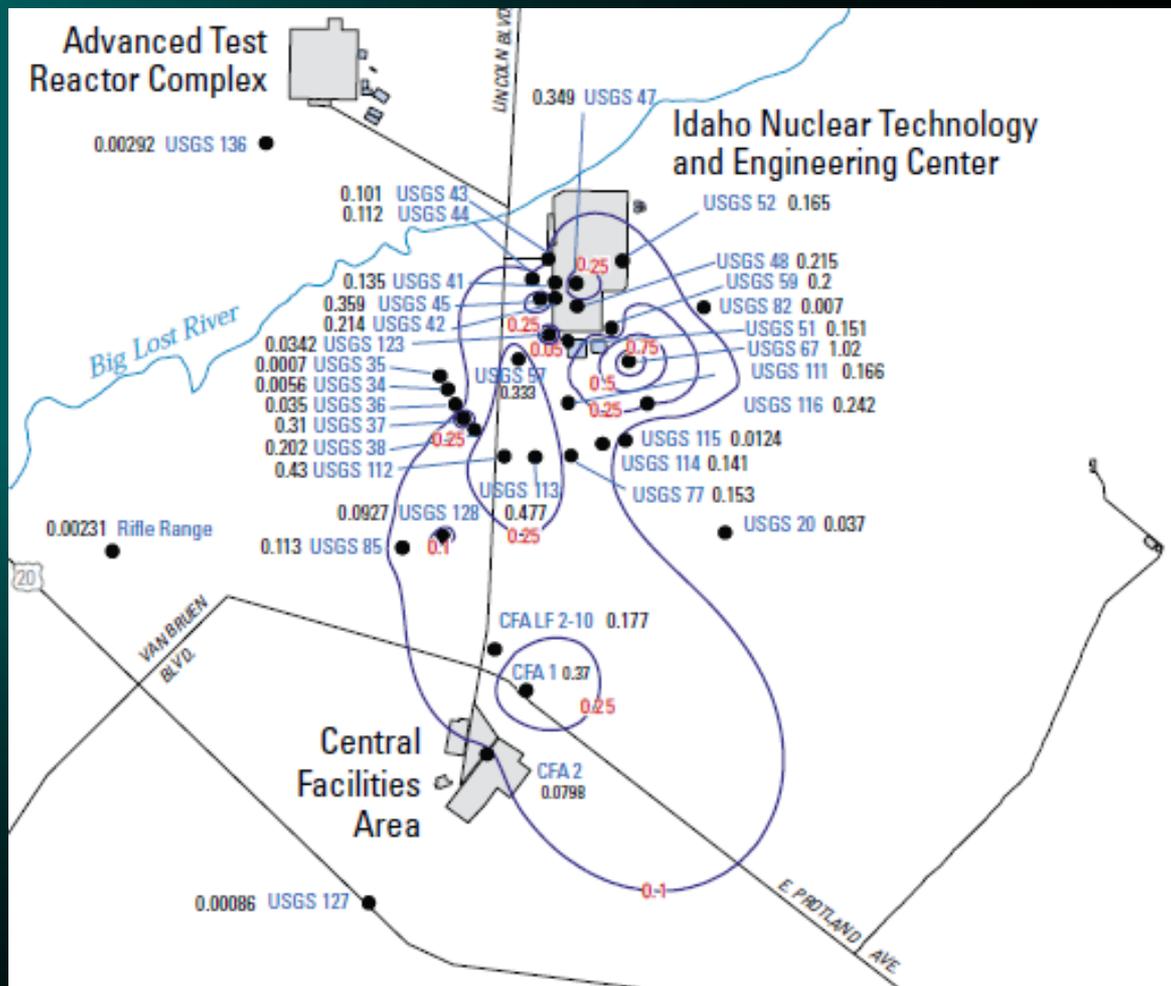

Iodine-129

Drinking water standard
is 1 pCi/L

Has a radioactive half life
of 15.7 million years.

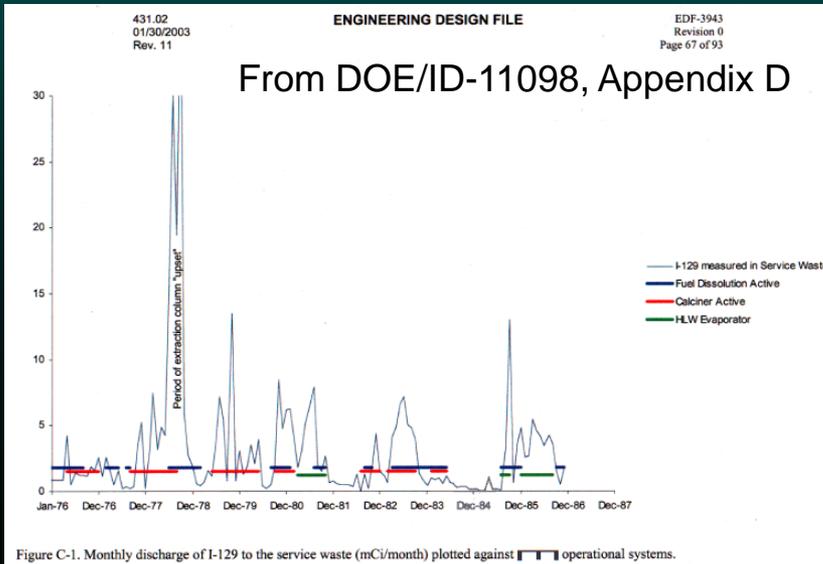

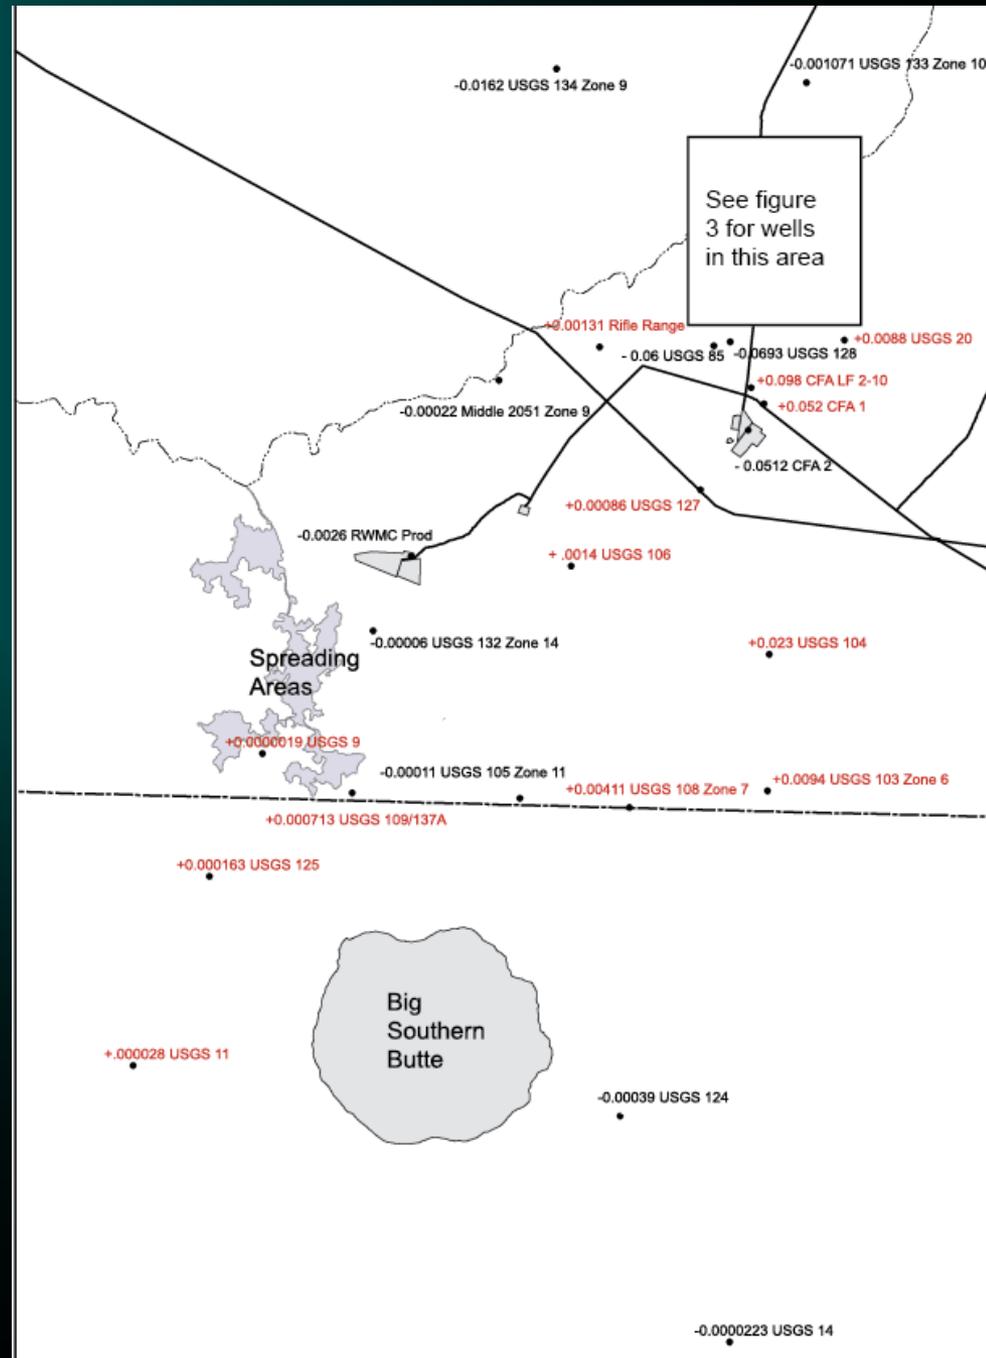

Still one well with a concentration
above the drinking water standard.

Background concentrations in the
Eastern Snake River Plain aquifer
are about 0.000005 pCi/L

When comparing previous data with 2011-12 data, concentrations in several wells near CFA, near the INL boundary, and south of the boundary showed slight increases.

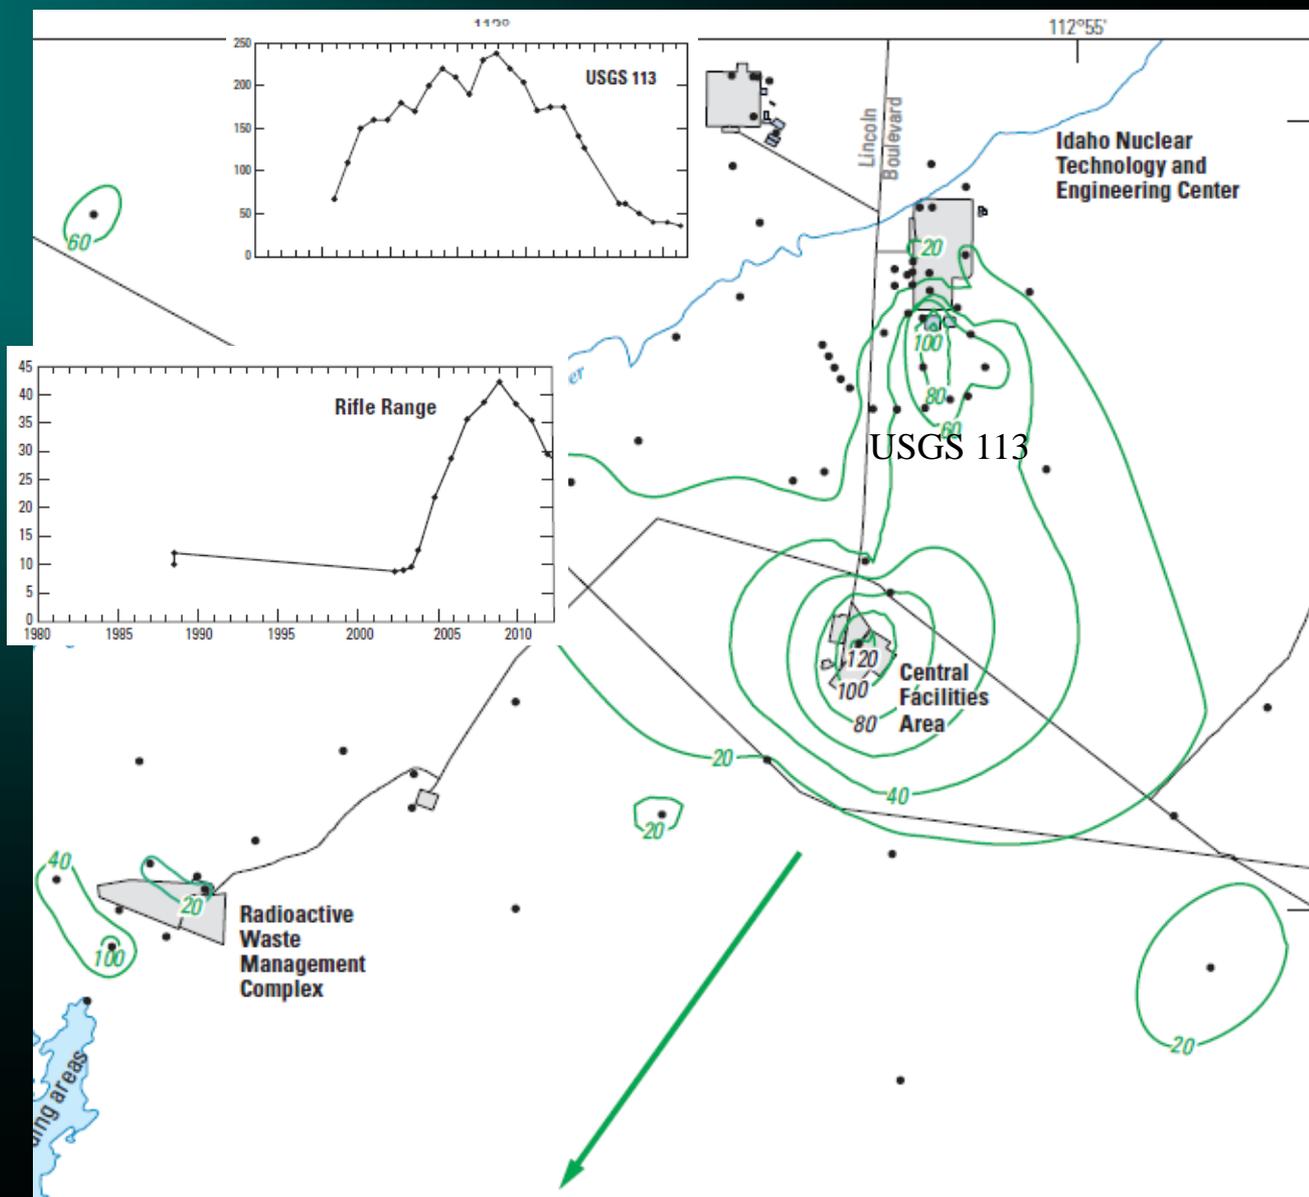

Increases may represent masses of water from larger disposal events such as those from 1957 and 1978 finally reaching these wells or may represent water from some other disposal period reaching the wells.

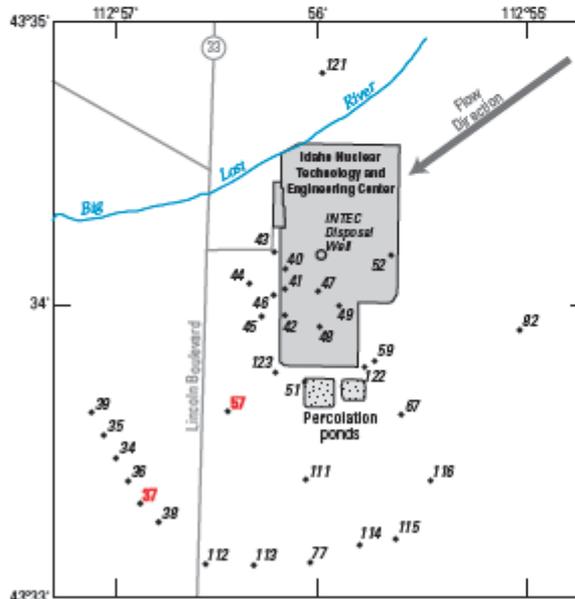

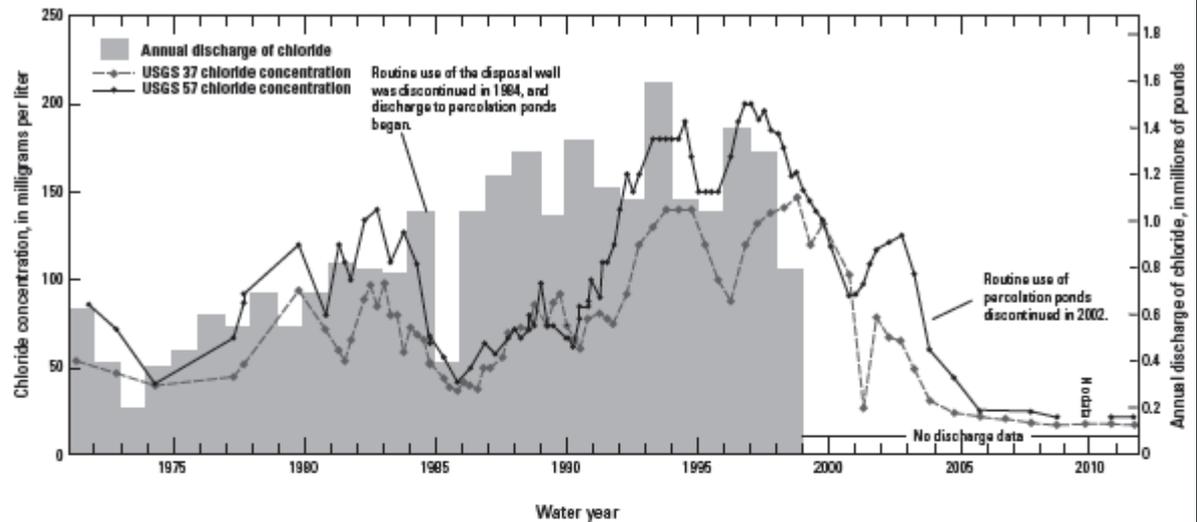

Chloride

Secondary drinking water standard is 250 mg/L

Background concentration is about 15 mg/L

We do see a lag between disposal and when it shows up in the wells, and the relation of chloride does correspond to disposal amounts.

Base from U.S. Geological Survey digital data, 1:24,000 and 1:100,000
 Universal Transverse Mercator projection, Zone 12
 Datum is North American Datum of 1927

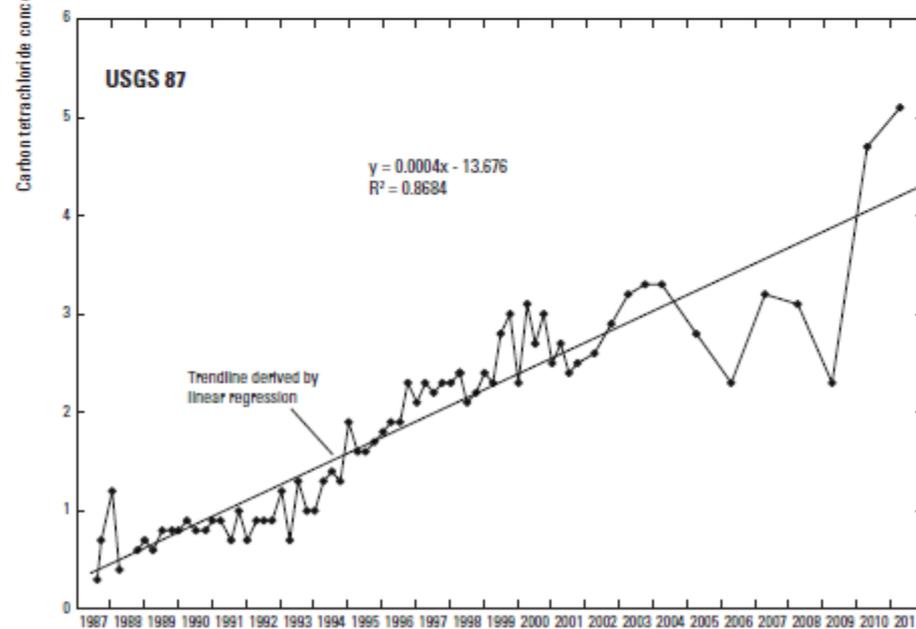

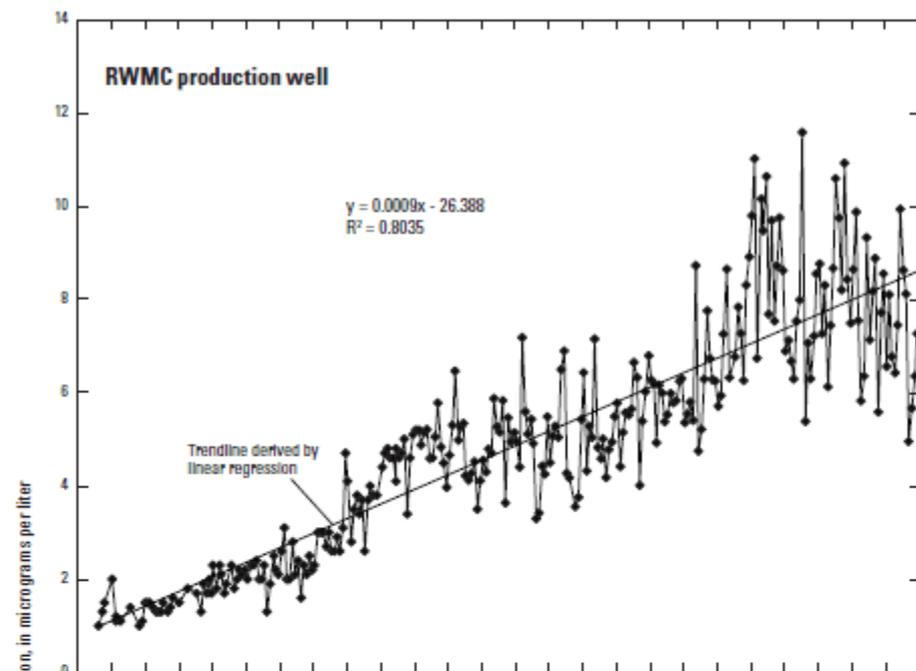

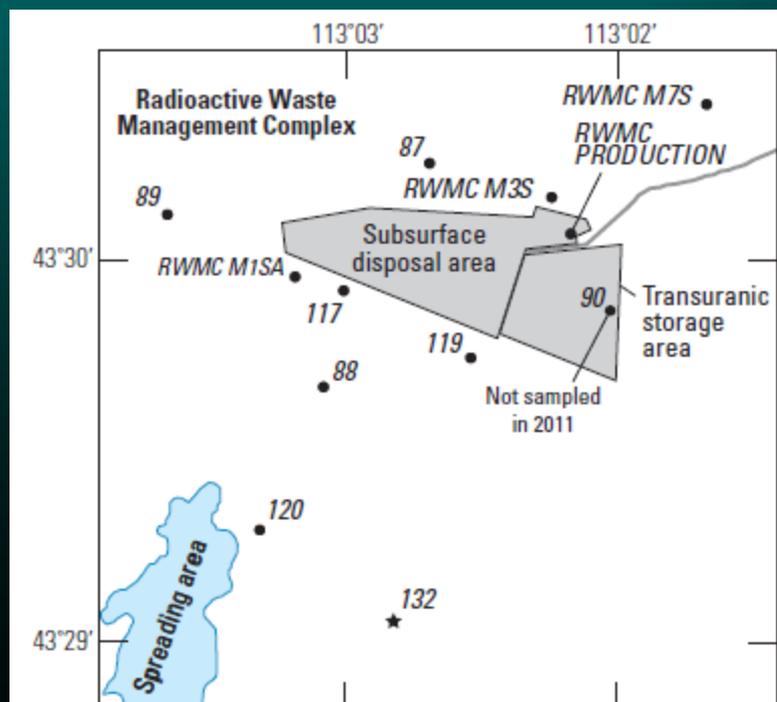

EXPLANATION

- Well in the USGS perched groundwater-quality monitoring network and identifier
- 82 Local well identifier—Number only shows USGS well, other names are local well names. Red well numbers indicate wells shown in chloride concentration graph.

Carbon tetrachloride

Drinking water standard is 5 µg/L

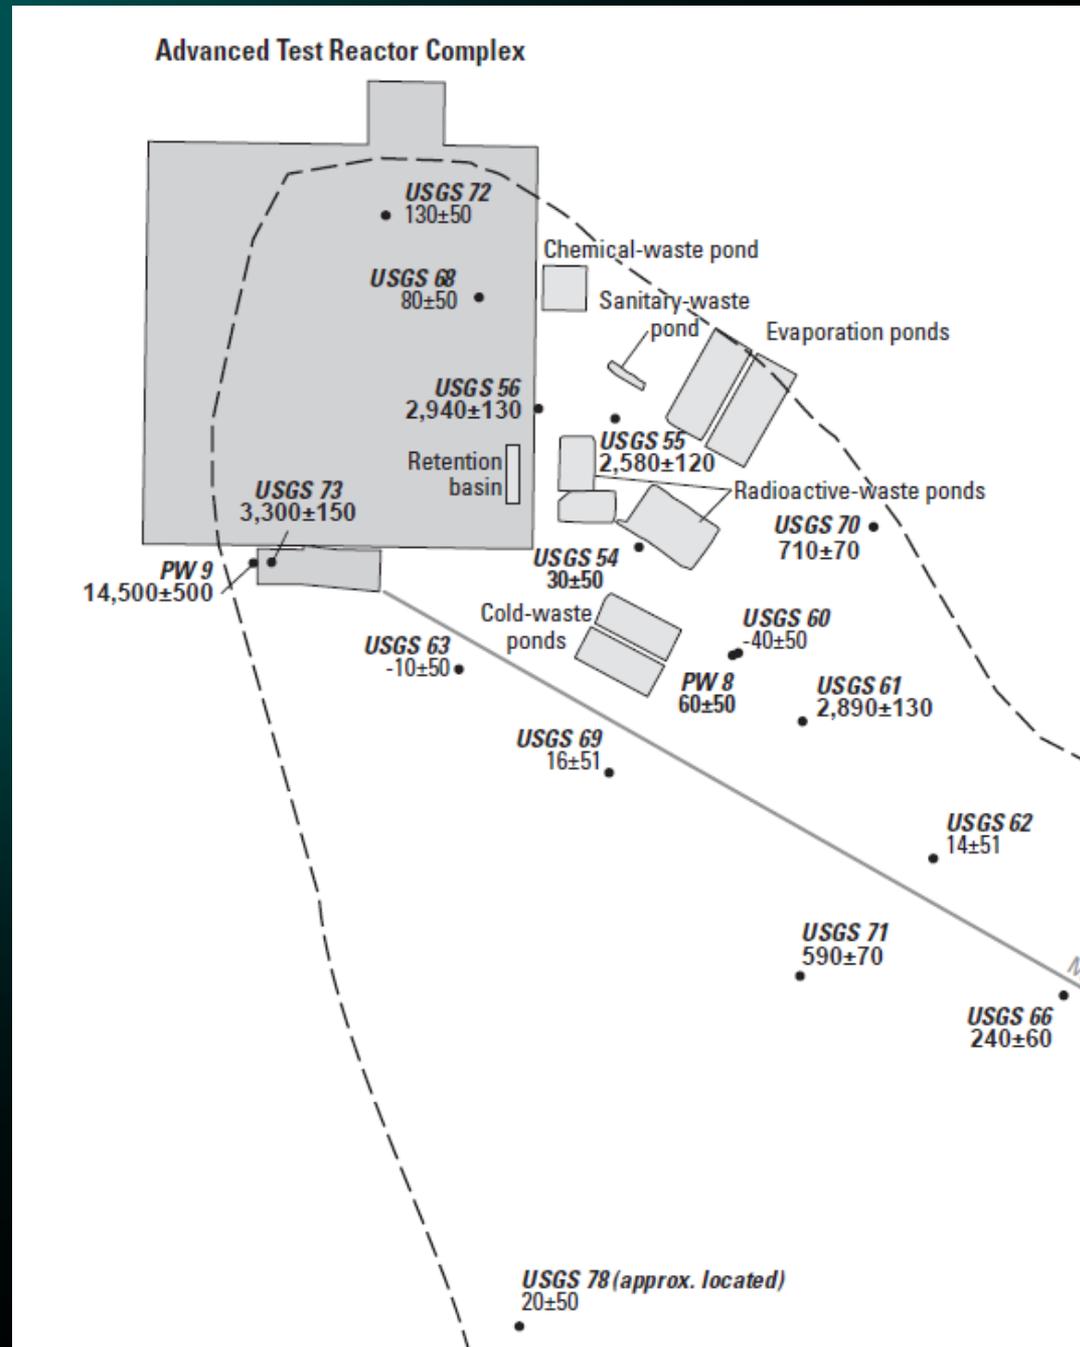

Perched Groundwater around ATRC

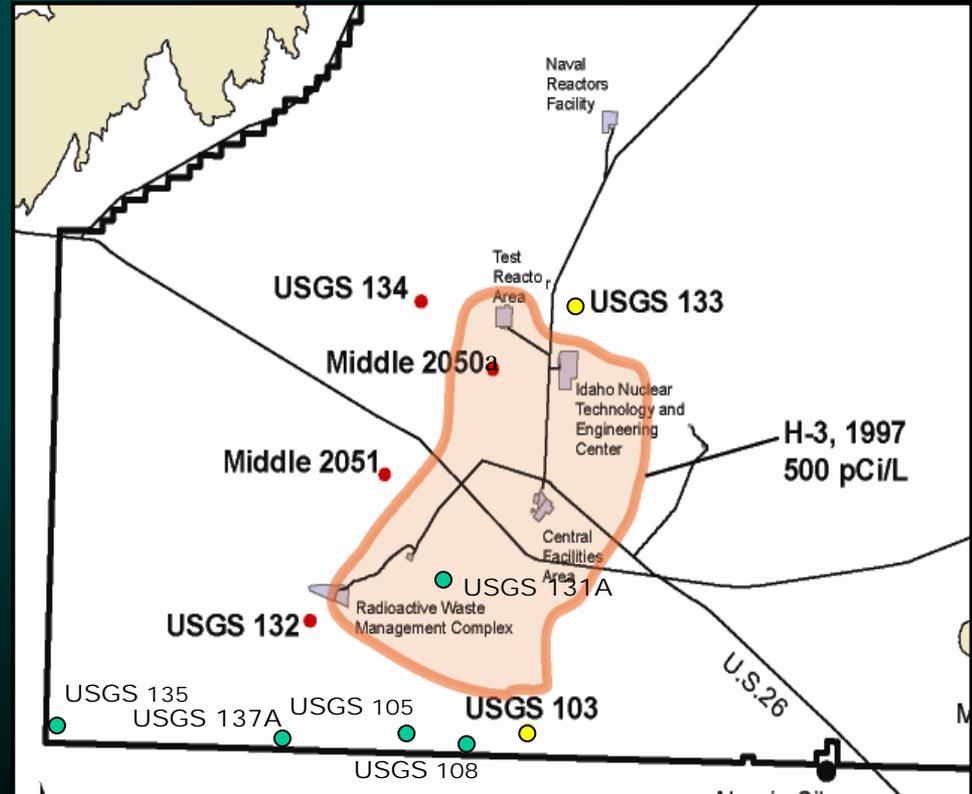

Key findings in 2011 was that tritium was below the drinking water standard in all wells.

Strontium-90 exceeded the drinking water standard in 4 wells.

One well had sulfate that exceeded its secondary drinking water standard of 250 mg/L.

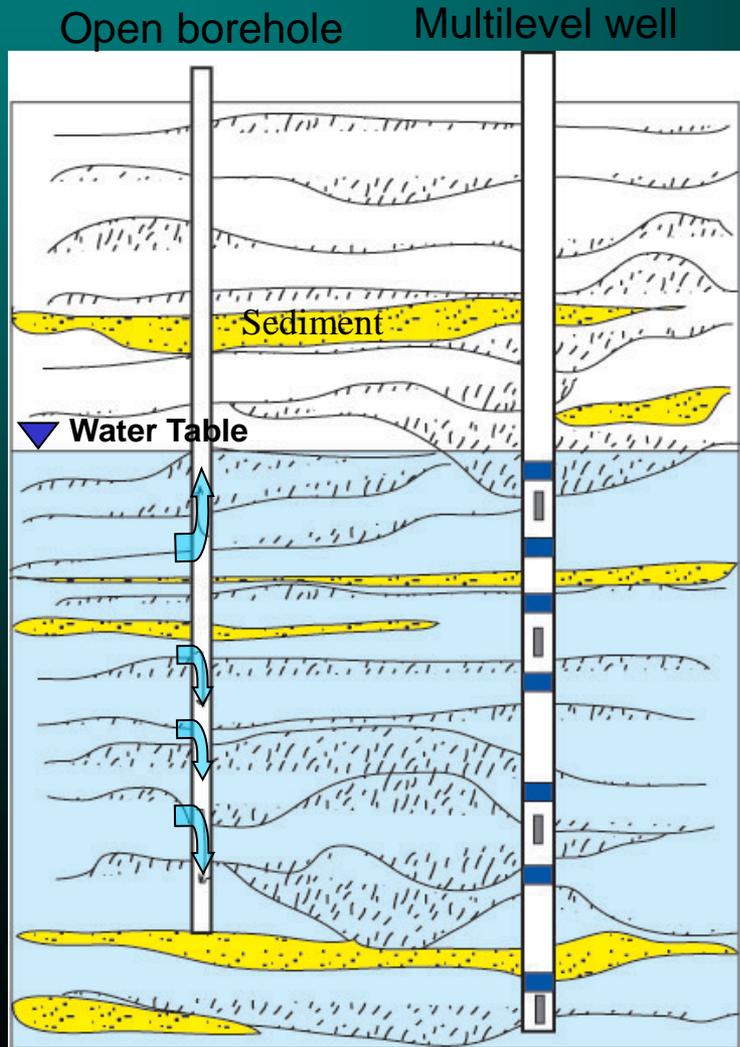

Multilevel Monitoring Site Locations

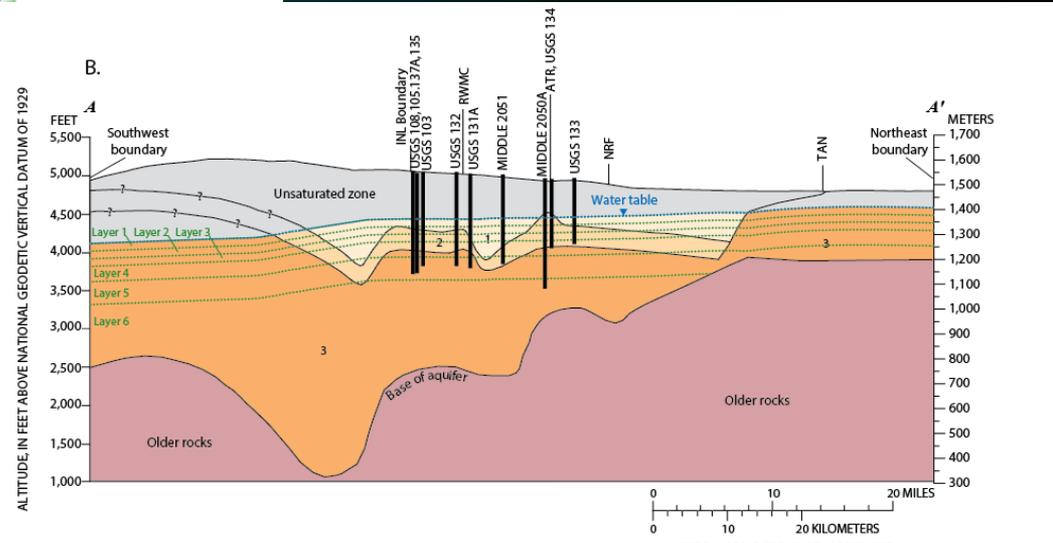

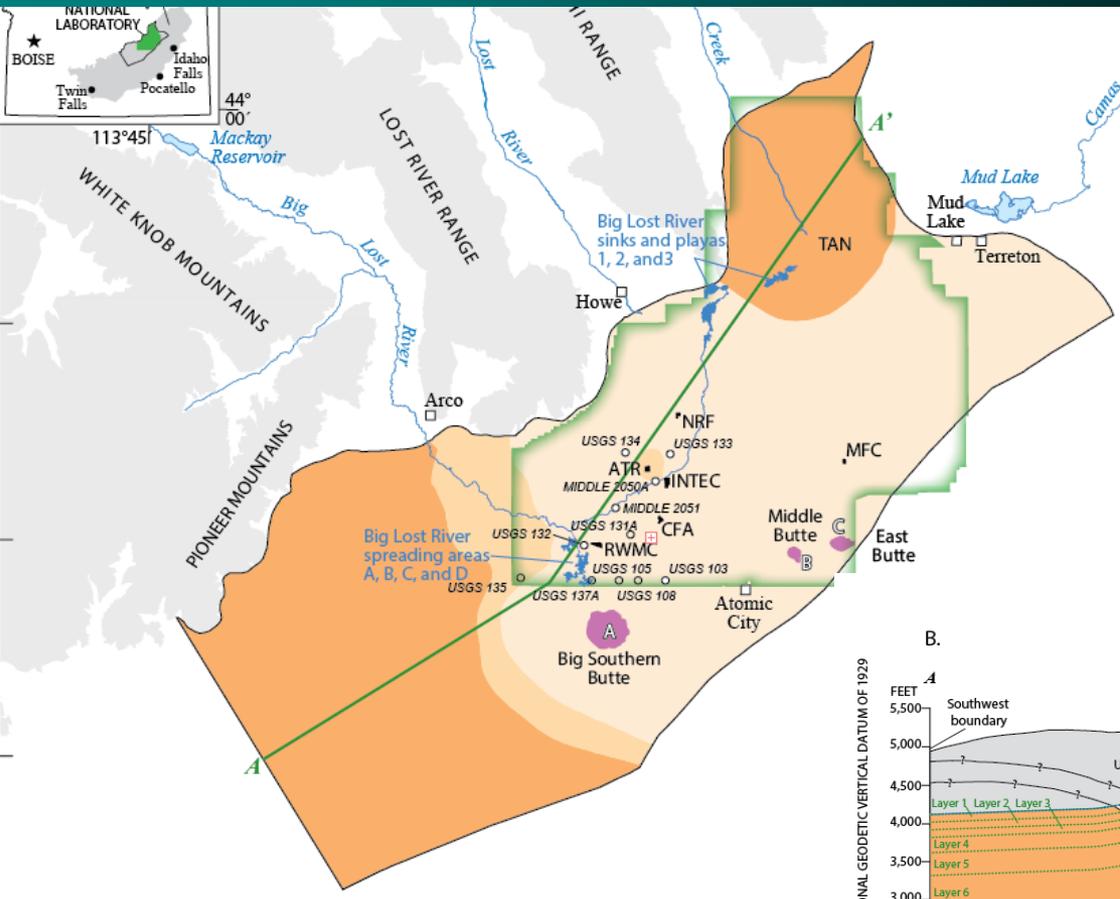

Monitor zones from 11 wells

Each well has from 4 to 7 sample ports

Advantages of Multilevel Systems

- Eliminates vertical mixing from open boreholes.
- Allow for discrete water sampling and piezometric head profiles without drilling multiple boreholes.
- Monitor data trends with time (contaminant movement, recharge waters).

Water Monitoring

The USGS has been studying the area's water resources since the INL was established in 1949. Initially, our studies focused on quantifying the volume of water in the eastern Snake River Plain aquifer and determining if the water quality was adequate for industrial use. As concerns mounted about the presence of radioactive and chemical wastes in the eastern Snake River Plain aquifer, we turned our attention to understanding the extent and movement of contamination in the area's vital groundwater.

In cooperation with the U.S. Department of Energy, we currently monitor [groundwater and surface-water quality](#) as well as [streamflow at seven surface water sites](#). Stage information at [Mackay Reservoir](#) is also available through other funding partners.

Water samples are collected and analyzed for selected common ions, trace elements, nutrients, radiochemical constituents, and organic compounds. Samples are analyzed by the [Radiological and Environmental Sciences Laboratory](#) and the [USGS National Water Quality Laboratory](#).

Since 1966, we've archived "raw" samples from each of our groundwater and surface water monitoring events. These samples are available to researchers.

Steady-State and Transient Models of Groundwater Flow and Advective Transport, Eastern Snake River Plain Aquifer, Idaho National Laboratory and Vicinity, Idaho

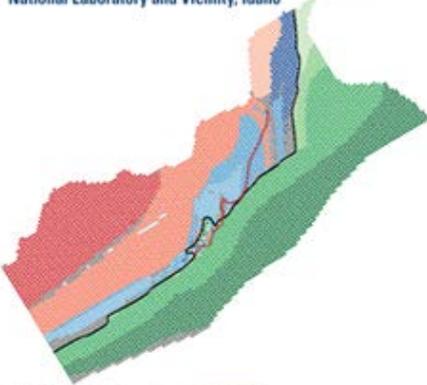

Scientific Investigations Report 2010-5123

Groundwater Model Development

Eastern Snake River Plain Aquifer

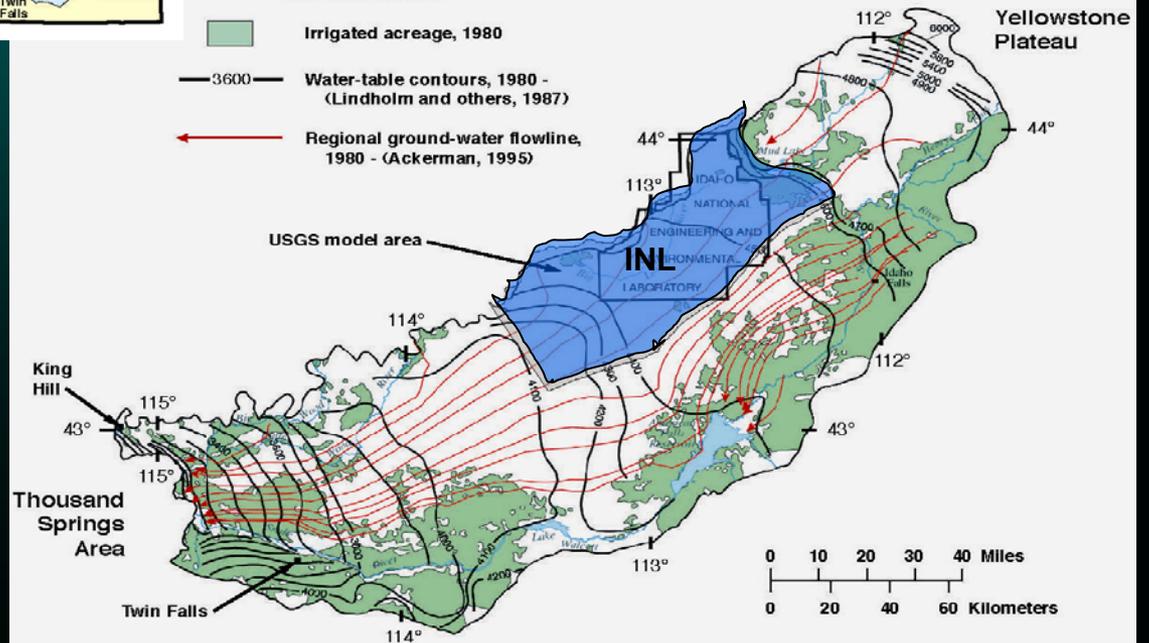

A Comparison of U.S. Geological Survey Three-Dimensional Model Estimates of Groundwater Source Areas and Velocities to Independently Derived Estimates, Idaho National Laboratory and Vicinity, Idaho

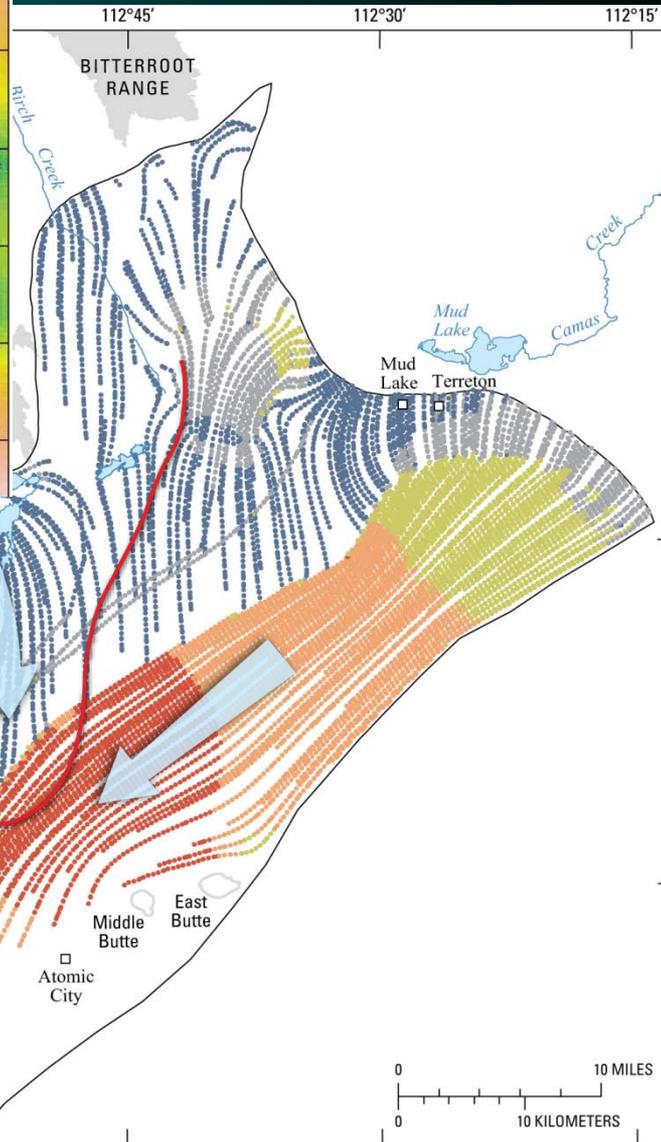

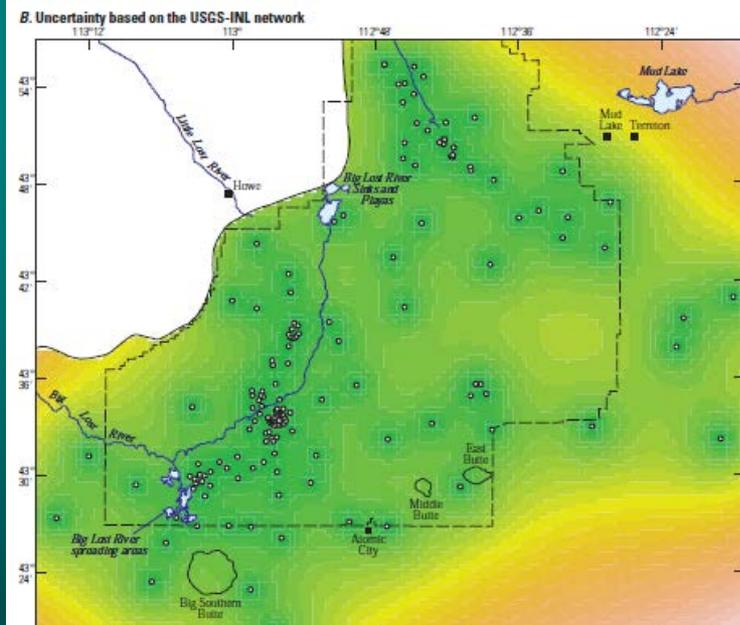

Scientific Investigations Report 2012-5152

EXPLANATION

- Irrigated acreage, 1980
- 3600 Water-table contours, 1980 - (Lindholm and others, 1987)
- Regional ground-water flowline, 1980 - (Ackerman, 1995)

Groundwater Velocity

General weakness of the model is too fast of flow in the eastern part of INL and south of Howe; model does OK in sediment-rich areas, not as well in sediment-poor areas

Idaho Completion Project

Where is the best place to monitor?

How many wells are needed to do the job?

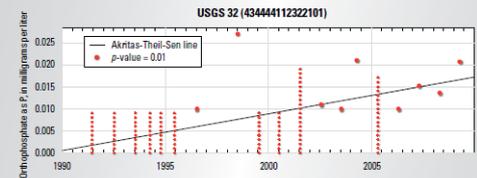

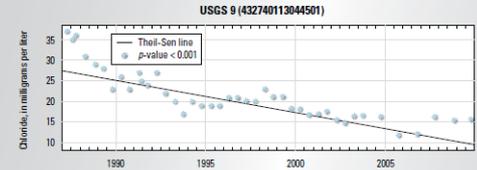

Can it be shown that sites selected for long-term monitoring are reliable ... can they be depended upon for early-warning?

Are model predictions of contaminant movement reliable and defensible?
