1	COUNCIL MEMBERS:	
2	CHARLES D. DAVIDSON	Chair
3		National Petroleum Council
4		Chair
5		Noble Energy, Inc.
6	REX W. TILLERSON	Vice Chair
7		National Petroleum Council
8		Chair, President & CEO
9		Exxon Mobil Corporation
10	NICHOLAS K. AKINS	Chair, President, & CEO
11		American Electric Power
12		Co., Inc.
13	GEORGE A. ALCORN, Sr.	President
14		Alcorn Exploration, Inc.
15	ROBERT NEAL ANDERSON	Global Head of Consulting
16		Wood Mackenzie, Inc.
17	THURMON M. ANDRESS	Managing Director
18		BreitBurn Energy, LP
19	ROBERT H. ANTHONY	Chair
20		Oklahoma Corporation
21		Commission
22	ALAN S. ARMSTRONG	President & CEO
23		The Williams Companies,
24		Inc.
25	GREGORY L. ARMSTRONG	Chair & CEO
26		Plains All American
27		Pipeline, LP
28	ROBERT G. ARMSTRONG	President
29		Armstrong Energy
30		Corporation
31	GREG A. ARNOLD	President & CEO
32		Truman Arnold Companies
33		

1 COUNCIL MEMBERS (Continued):

2	PHILIP K. ASHERMAN	President & CEO Chicago Bridge & Iron Company NV
3		
4	VICKY A. BAILEY	President Anderson Stratton Enterprises, LLC
5		
6	RILEY P. BECHTEL	Chair Bechtel Group, Inc.
7		
8	MICHAEL BENEZIT	Adviser to the Chair & CEO Total S.A.
9	ANTHONY J. BEST	Director SM Energy Company
10		
11	DONALD T. BOLLINGER	Chair & CEO Bollinger Enterprises, LLC
12	KEVIN D. BOOK	Managing Director, Research ClearView Energy Partners, LLC
13		
14	JOHN F. BOOKOUT	Houston, Texas
15		
16	JASON E. BORDOFF	Professor of Professional Practice in International & Public Affairs Director Center on Global Energy Policy, Columbia University
17		
18		
19	CHRIS BROWN	President Vestas Americas, USA
20		
21	PHILIP J. BURGUIERES	CEO EMC Holdings, LLC
22		
23		

1	COUNCIL MEMBERS (Continued):	
2	MATTHEW D. CABELL	President
3		Seneca Resources Corporation
4	KATERI A. CALLAHAN	President
5		Alliance to Save Energy
6	DEBORAH H. CAPLAN	Executive Vice President
7		NextEra Energy, Inc.
8	ROBERT B. CATELL	Chair
9		Advanced Energy Research & Technology Center
10	STEPHEN I. CHAZEN	Stony Brook University
11		President & CEO
12	EILEEN B. CLAUSSEN	Occidental Petroleum Corporation
13		Former President
14	KIM R. COCKLIN	Center for Climate & Energy Solutions
15		President & CEO
16	THOMAS B. COLEMAN	Atmos Energy Corporation
17		Former CEO
18	MARTIN S. CRAIGHEAD	International-Matex Tank Terminals
19		Chair, President, & CEO
20	WILLIAM A. CUSTARD	Baker Hughes Incorporated
21		President & CEO
22	TIMOTHY J. CUTT	Dallas Production, Inc.
23		President
	D. SCOTT DAVIS	Petroleum & Potash
		BHP Billiton Petroleum
		Chair & Former CEO
		UPS

1	COUNCIL MEMBERS (Continued):	
2	DAVID R. DEMERS	CEO Westport Innovations, Inc.
3		
4	CLAIBORNE P. DEMING	Chair Murphy Oil Corporation
5	DAVID M. DEMSHUR	Chair, President, & CEO Core Laboratories N.V.
6		
7	JOHN M. DEUTCH	Institute Professor Department of Chemistry Massachusetts Institute of Technology
8		
9	LAURENCE M. DOWNES	Chair & CEO New Jersey Resources Corporation
10		
11	W. BYRON DUNN	CEO Tubular Synergy Group, LP
12		
13	BERNARD J. DUROC-DANNER	Chair, President & CEO Weatherford International, Ltd.
14		
15	GREGORY L. EBEL	Chair, President, & CEO Spectra Energy Corp.
16	KATHLEEN M. EISBRENNER	Founder & CEO NextDecade, LLC
17		
18	MARK E. ELLIS	Chair, President & CEO LINN Energy, LLC
19	JOHN W. ENGLAND	Vice Chair & U.S. Oil & Gas Leader Deloitte, LLP
20		
21	RONALD A. ERICKSON	Chair & CEO Holiday Companies
22		
23	DAWN L. FARRELL	President & CEO TransAlta Corporation

1	COUNCIL MEMBERS (Continued):	
2	G. STEVEN FARRIS	Non-Executive Chair Apache Corporation
3		
4	JOHN A. FEES	Chair The Babcock & Wilcox Company
5		
6	TIMOTHY C. FELT	President & CEO Colonial Pipeline Company
7		
8	FEREIDUN FESHARAKI	Chair FACTS Global Energy
9		
10	WILLIAM L. FISHER	Borrow Chair & Professor Department of Geological Sciences Jackson School of Geosciences The University of Texas
11		
12	JAMES C. FLORES	President & CEO Freeport-McMoRan Oil & Gas, LLC
13		
14	PAUL L. FOSTER	Executive Chair Western Refining, Inc.
15		
16	RANDY A. FOUTCH	Chair & CEO Laredo Petroleum, Inc.
17		
18	BENJAMIN G. S. FOWKE, III	Chair, President & CEO Xcel Energy, Inc.
19		
20	JEANNE M. FOX	Former Commissioner Board of Public Utilities State of New Jersey
21		
22	THOMAS A. FRY, III	Proprietor Fry Advisors
23		
24	GREG C. GARLAND	Chair & CEO Phillips 66 Company

1 lobby level it's not going to be too complicated.
2 There's no scheduled fire alarms today, so if the
3 alarm sounds, we'll evacuate through the doors in
4 the back, and you can go either of two directions:
09:08:21 5 out to the courtyard, or out through the lobby.

6 And, then, our muster point is the
7 Capitol Hilton Hotel just across the street, across
8 K Street. So, again, just a reminder to keep
9 ourselves safe.

09:09:09 10 And, now, if there's no objection, I
11 will dispense with the calling of the role, and for
12 members of the Council to check in inside the
13 Chandelier Room there; will serve as our official
14 attendance record for this meeting. Any members or
09:09:22 15 observer for a member who has not checked in,
16 please do so before you leave so we'll have a (sic)
17 accurate record of who was in attendance today.

18 We also have an extended audience with
19 us today joining by webcast so that they'll be able
09:09:39 20 to follow along with the proceedings with us as
21 well. At the end of the meeting the presentation
22 slides, and, if approved, the Arctic Research Study
23 Draft Final Report will be posted on the NPC's web

1 site.

2 Now I'd like to now introduce, for the
3 Record, the participants at our head table. As
4 many of you know, Secretary of Energy Moniz is
09:10:06 5 deeply involved in the Iranian talks.

6 He's unable to be with us this morning
7 as he's with the U.S. delegation in Swisserland as
8 the negotiations continue. On my right, on my
9 right -- Having trouble pronouncing here. -- we're
09:10:24 10 joined by Assistant Secretary Elizabeth
11 Sherwood-Randall, who is serving as the Council's
12 Acting Government Cochair today.

13 She is also the Government Cochair of
14 the NPC Arctic Research Committee.

09:10:39 15 Liz, we're really pleased that you're
16 here with us today both as a, in really both your
17 capacities. So, thank you so much.

18 Next is the Chair of the Arctic Research
19 Committee, Rex Tillerson, who, in addition to that
09:10:54 20 role, serves as Vice Chair of the National
21 Petroleum Council.

22 And, next to Rick, next to Rex is Chris
23 Smith, Assistant Secretary for Fossil Energy.

1 And, next to Chris is Marshall Nichols,
2 Executive Director of the Council.

3 So, our primary business this morning is
4 to review the work of the NPC's Committee on Arctic
09:11:16 5 Research, discuss their findings and
6 recommendations, and vote on the adoption of their
7 proposed Final Report as the Council's response to
8 the Secretaries request.

9 Many members, many, many members of the
09:11:31 10 Council have provided outstanding leadership and
11 involvement and commitments of their own personal
12 time and their organization's resources to help
13 respond to the Secretary's request for advice on
14 this very important issue.

09:11:47 15 Rex Tillerson, Chair of the Committee on
16 Arctic Research, will kick off the presentation,
17 the results of this comprehensive study.

18 So, I'll turn it over to you, Rex.

19 CONSIDERATION OF THE PROPOSED FINAL REPORT OF THE
09:11:55 20 NPC COMMITTEE ON ARCTIC RESEARCH:

21 MR. TILLERSON: Well, thanks, Chuck.

22 And, it really is a -- welcome the
23 opportunity to represent the work of this Study

1 Group, which has been broad in its scope, deep in
2 its investigation, and I think you'll, you'll find
3 is going to be very useful in terms of informing a
4 number of interested parties on the subject.

09:12:21

5 If we can, though, go to the, the first
6 slide. I don't know that I have control.

7 There. Here it is.

8 I do have control. We'll see if I can
9 operate the control.

09:12:33

10 That didn't do anything. Let's try a
11 different one.

12 Aah, there we go. Need remedial
13 training in slide manipulation.

09:12:46

14 So, I think, as most of the members of
15 the Council are aware, Secretary Moniz, back in his
16 letter of October, 2013, did request the Council to
17 conduct a study, and we've included the, an excerpt
18 quote from his letter, which I, I'm just going did
19 read verbatim.

09:13:03

20 What research should the Department of
21 Energy pursue and what technology constraints must
22 be addressed to ensure prudent development of
23 Arctic oil and gas resources while advancing U.S.

1 energy and economic security and ensuring
2 environmental stewardship?

3 So, that was the fundamental question
4 that was put before the Council. I think, and, as
09:13:25 5 the Secretary noted in his letter, part of what
6 prompted his request, and I think it was a very
7 timely request, was the upcoming assumption by the
8 United States of the chairmanship of the Arctic
9 Council.

09:13:41 10 And, the Secretary also, I think, when
11 he was here last meeting with the Council, also
12 referred to the Energy Department's quadrennial
13 energy review which was being undertaken. So, I
14 think, obviously, he felt this was an appropriate
09:13:52 15 time to put these questions before the Council.

16 So, little bit of context I think for
17 the study. And, and, there's much of this
18 contained in the study, itself, but I think there
19 is, today, an increasing awareness that conditions
09:14:07 20 in the Arctic are undergoing some level of change
21 in terms of free ice conditions, how ice is
22 changing, access to the Arctic, not just in the
23 U.S., but globally.

1 And, so, there are growing interests in
2 the Arctic from the standpoint of what economic
3 opportunities that may begin to open, not just in
4 natural resource development, but in trade
09:14:30 5 development, as well, but a recognition, also, of
6 concerns about the culture of Arctic peoples, and
7 how that is being impacted by this changing
8 environment as well.

9 Other countries clearly are moving
09:14:42 10 forward in their own investigation and development
11 of the Arctic. Arctic nations, themselves, but
12 also nations who don't have direct Arctic
13 territories are also moving forward with their
14 interest in and investigation and technologies that
09:14:58 15 allow access to the Arctic to be used either for
16 economic trade or for military purposes.

17 The Arctic does contain, I think as many
18 of you know, the largest remaining undiscovered
19 potential or unconventional oil and natural gas on
09:15:16 20 the globe. About 25 percent of the world's
21 remaining undiscovered conventional oil the natural
22 gas potential is in the Arctic.

23 And, a large provide portion of that is

1 in the U.S. waters of the Arctic, in particular
2 when it comes to undiscovered oil potential. The
3 industry does have a long history of activity and
4 successful development in the Arctic, globally
09:16:05 5 dating back to the 1920s, but in particular, in the
6 U.S. offshore Arctic dating back to the 1970s and
7 1980s.

8 So, technology does exist to safely
9 explore for and develop this potential. And, that
09:16:38 10 technology has, in fact, been demonstrated with
11 developments that have progressed in the Arctic
12 while maintaining environmental stewardship.

13 Obviously, further development of the
14 Arctic, I think, as recognized by most, would
09:16:51 15 enhance both the United States national security,
16 our economic security by enhancing our energy
17 security. They all are interrelated.

18 And, in recognition of this interest,
19 though, there are a number of differing views over
09:17:06 20 how we should proceed, and a number of differing
21 views over areas of concern as we further progress
22 with development in the Arctic. And, so, it's
23 really in this context that an integrated work plan

1 with a diverse and experienced study team was
2 needed.

3 And, that really drove how we
4 constructed the approach to this study. So, this
09:17:28 5 is a reminder of the scope.

6 I think I've shared this with you when
7 we last met. And, we really broke the study into
8 two principal components, what we call the print
9 and development scope, which was to provide context
09:17:43 10 for then addressing this, the Secretary's specific
11 questions around research and technology.

12 And, in the predevelopment scope, again,
13 we developed this context around the history of the
14 Arctic, what has already been demonstrated. We
09:17:57 15 provide both a global and a U.S. perspective, but
16 clearly the study concentrates on the U.S.

17 And, we did make some observations on
18 the onshore and the offshore, although, as you see
19 in the study, we focused most of the attention on
09:18:15 20 the offshore because that's where most of the
21 resource opportunity exists today.

22 In the proven-development part of the
23 study there are four chapters, which are shown on

1 the right, which further develop these themes,
2 including the last, which is policy and regulatory
3 opportunities to promote crude development. And, I
4 want to, I want to be clear on all of this.

09:18:56

5 As you all know, the Council is not an
6 advocacy organization, and so when we dealt with
7 these policy and regulatory questions we were
8 really looking at: How does technology impact upon
9 or enable regulatory consideration? And, make some

09:19:09

10 observations about how the current framework of
11 Regulations around the Arctic, we believe, deserve
12 a review and an updating, taking into consideration
13 how technology has changed and advanced over the
14 last several years, and that technology can be used
15 to inform a review and update of those Regulations.

09:19:25

16 The second part of the study, the
17 research and technology scope, then, again, the
18 emphasis, as I indicated, was given to potential
19 offshore because we see that as the largest prize,
20 the most likely economic development. And, most of
21 the observations we would make in the offshore, you
22 could easily translate those to the onshore as
23 well.

09:19:41

1 So, we looked at the research and
2 technology needs, what the current state of
3 technology research is, recognition that throughout
4 the many, many decades of activity in the Arctic,
09:20:02 5 research technology and development has been a
6 (sic) ongoing quest of the, of the industry, and
7 that has continued on a very continuous basis.

8 We make a lot of -- In that regard we
9 make observations where we see potential
09:20:16 10 opportunities for further advancements and
11 recommendations and priorities for the U.S.
12 Government.

13 So, the Technology and Research part of
14 the study is then divided into subparts, and you
09:20:28 15 can see there are six chapters. Four of the
16 chapters deal with the, what I would call the
17 engineering, technical, and, and operating
18 departments.

19 And, then we have two chapters that deal
09:20:39 20 with the ecological environment and the human
21 environment in terms of: Are there additional
22 research opportunities around species, subspecies,
23 and are there additional research opportunities or

1 gaps around how development impacts upon Native
2 people's that, that reside in the Arctic
3 environment, and how these interact with one
4 another.

09:21:02 5 The study then was organized, as you see
6 on this, this chart. I chair the Study Committee.

7 Carol Lloyd, Vice President of Exxon
8 Mobil Upstream Research Company is Chair of the
9 Coordinating Subcommittee. And, then you see the
09:21:36 10 three subgroups around the scope that I just
11 described.

12 So, at this point I want to turn it over
13 to Carol and let her pick it up and take you
14 through a more detailed review of the contents of
09:21:51 15 the study.

16 Carol.

17 MS. LLOYD: Thank you. Thank you, Rex.

18 Good morning, everyone, and, and
19 welcome. I'm going to begin by thanking the Team
09:22:05 20 that I'm standing up here representing, the
21 Coordinating Subcommittee.

22 Firstly I would like to acknowledge my
23 Government Cochair, Paula Gant, who's with me here

1 today; our assistants, Doug Foyt (phonetic) and
2 Nancy Johnson; our Writing Team Leader, Tom
3 Eisenberg (phonetic), and our secretary, John Guy
4 (phonetic), from the National Petroleum Council.

09:22:45

5 As Rex outlined, we broke the study into
6 three parts, and we had three different Chairs of
7 those Work Groups. The Predevelopment Team was led
8 by Chevron, Mr. Bill Scott, and assisted by Steven
9 Laws (phonetic), from ExxonMobil.

09:23:27

10 The Engineering Research chapters were
11 led by Jed Hamilton of ExxonMobil, assisted by many
12 different companies, notably Shell and Chevron who
13 led significant chapters. And, then, finally, the
14 Ecology and Environment chapters were led by Dr.

09:23:46

15 Michael Macrander, from Shell, assisted by many
16 companies and regulatory agencies, environmental
17 organizations, and the industry.

09:24:23

18 Additionally, I would like to recognize
19 the contributions from the many companies that
20 helped us out with significant contributions. You
21 know who you are, Rochelle, Schlumberger, Fluor,
22 Goldman Global Strategies, Stafford Oil, BP, CSIS.

23 And, a special thanks to the members of

1 your team from Alaska who traveled many miles to
2 join us as we conducted our deliberations and dealt
3 with the time change, many of them on the phone
4 with numerous cups of coffee, specifically Richard
09:25:12 5 Glenn and Drew Pierce, who served on the
6 Coordinating Subcommittee. And, they're here with
7 us today.

8 So, Team, thank you very much. It's my
9 pressure to stand up here and represent your work.

09:25:22 10 In the time that I have with you today
11 I'm going to cover four topics. I'm going to
12 briefly cover the process that we used to conduct
13 the study.

14 Then I will go into the report key
09:25:31 15 findings, then the recommendations, and then I will
16 move on to, to next steps. And, then I'll turn the
17 floor back to Mr. Tillerson for some discussion,
18 further discussion.

19 So, in the next slide -- All right. So,
09:25:47 20 let me use this slide to describe briefly the
21 process and the diversity of the team.

22 The Coordinating Subcommittee had 26
23 team members from 20 different organizations, and

1 you can see that we were roughly evenly split
2 between industry and nonindustry participants.
3 Beginning in May of 2014, after we had a Work Plan
4 which was agreed on by the Study Committee, we
09:26:12 5 began meeting every month.

6 And, we met every month from May until
7 this month, and even over Thanksgiving and, and
8 Christmas break. The Coordinating Subcommittee met
9 to deliberate on the technical work products which
09:26:26 10 were being developed by the technology staff and to
11 provide steerage as we worked along, and then later
12 to synthesize these findings into the Executive
13 Summary which we're presenting today.

14 The Prudent Development Team was led by
09:28:09 15 Chevron, nearly 50 team members from 120 different
16 organizations. And, Mr. Tillerson described the
17 scope that their deliberations covered.

18 The, the Engineering Team had the
19 largest team by far from over 50 organizations
09:28:22 20 representing, not surprisingly, given the topics,
21 academia, government, researchers, the national
22 labs, et cetera.

23 And, finally, the Environmental Team had

1 22 team members from 13 different organizations,
2 including NGO organizations.

3 The two Research Teams collaborated to
4 host two technology workshops which I'll tell you a
09:28:46 5 little bit more about on the next slide. So, the
6 pie chart, the pie chart illustrates the diversity
7 of the team.

8 We had 266 participants in total from
9 105 organizations. You can see that roughly 40
09:29:01 10 percent of the participants were from industry,
11 both from the ENP companies and the supply
12 companies.

13 Consultants, roughly six percent;
14 government organizations, both federal and state,
09:29:13 15 about 30 percent; Alaska Natives, about six
16 percent; NGO think tanks, about four; and, then,
17 finally, academia, about 12.

18 And, so, overall, very pleased with, as
19 Mr. Tillerson outlined, the breadth and the depth
09:29:30 20 of the team that we were able to assemble.

21 Talking a little bit more on the next
22 slide about the, the external engagements, I
23 mentioned the technology workshops. The purpose of

1 these workshops were to reach out to the many
2 people that were doing Arctic research in order to
3 be able to fully describe and catalog the
4 significant amount of research that was going on in
09:29:54 5 the technical topics which we covered to fully,
6 fully address the Secretary's question.

7 We held a federal workshop in September
8 at Resources For the Future. We had 54
9 participants, including the majority from the
09:30:08 10 national labs.

11 And, key finding from that workshop is,
12 was that there's a need for collaborative studies
13 and ongoing, potentially, validation, especially
14 where, in places where the industry views the
09:30:24 15 technology as proven, but all stakeholders have not
16 yet been, are not yet accepting of that.

17 And, some examples I'd cite that came up
18 in the workshop, which you will see in our
19 subsequent recommendations, are capping and subsea
09:30:58 20 shutoff technology as a replacement for same-season
21 relief well; oil-spill response methods in ice
22 beyond mechanical recovery; detection of oil in ice
23 through remote sensing; the interaction of key

1 species with ice and with oil and gas activities;
2 remote ice thickness measurements using detection;
3 and, then, finally, operations during the shoulder
4 seasons when ice is present.

09:31:44

5 Following the federal workshop we had an
6 Alaska workshop at the University of
7 Alaska-Fairbanks; 57 participants, the majority of
8 those from Alaska-based organizations. The
9 technology findings, not surprisingly, were

09:31:59

10 identical to the ones that were brought up during
11 the Washington-based workshop, but additional, and
12 probably most importantly, coming out of this
13 workshop, the team members that ultimately framed
14 the report and the recommendations were provided
15 with a deep local perspective of what mattered to
16 the Alaska people.

09:32:12

17 In addition to these two workshops we
18 conducted 21 sessions during the course of the
19 study's development to reach out to other
20 interested parties that had an intersection with
21 the scope of our report.

09:32:24

22 Turning my attention now to my second
23 topic, I'll walk through the, the Key Findings in

1 the report. This page highlights them all on one
2 page so they're, they're easy for, for you to see
3 and, and digest.

09:32:49

4 And, then, in the subsequent pages I'll
5 give you a little more commentary on each of these
6 in turn. So, one of the findings has been the
7 subject of some debate, and, as this is a technical
8 report first and foremost, we put it in logical
9 technical order beginning firstly with the resource

09:33:06

10 potential, and then moving in Finding 2 to the
11 Arctic physical, ecological, and human environment,
12 which we found was well-understood after decades of
13 research from multiple organizations across
14 industry, academia, and, and government
15 organizations.

09:33:25

16 In Finding 3 we cover the significant
17 experience of the industry in the Arctic and Arctic
18 life conditions, nearly a decade of experience, and
19 the role of technology in enabling that.

09:33:38

20 And, then, finally, or and then in
21 Finding 4, arguably the most important key
22 conclusion of the study, most of the U.S. Arctic
23 offshore is developed today with existing

1 technology.

2 However, technology alone is not enough,
3 and we must also, in order to move forward, have a
4 development that's economically viable, as we
09:34:00 5 described in Finding 5. And, we must also have
6 public confidence to move forward, as described in
7 Finding 6.

8 And, then, finally, there have been
9 substantial recent technology and regulatory
09:34:13 10 advancements in the area of oil-spill prevention
11 and oil-spill response in ice. And, these
12 technologies are not yet accepted for use in the
13 U.S. Arctic, opening up the door for our
14 recommendations on collaborative work to enable
09:34:45 15 that.

16 So, turning our attention to the first
17 finding on the resource potential, as Mr. Tillerson
18 mentioned, the global Arctic resource contains a
19 significant portion, about 25 percent of the
09:35:00 20 global, of the world's conventional undiscovered
21 resources.

22 We used the U.S. Geological Survey's
23 assessment. And, in the Executive Summary we used

1 the mean estimates, although anyone schooled in, in
2 this topic will know that there's significant
3 uncertainty.

09:35:20

4 The total resource endowment in the
5 conventional global Arctic, onshore and offshore,
6 is shown in the figure on the bottom left. In
7 total we have 923 billion barrels of oil equivalent
8 represented.

09:35:33

9 Beginning at the 12:00 o'clock position
10 you can see that about one-third is either produced
11 or current reserves with development plans in place
12 to be able to access. The majority of those are in
13 exclusively, almost exclusively in the U.S. and
14 Russia.

09:35:49

15 And, then moving around the pie we see
16 the discovered but not yet developed resource
17 potential, about 100 billion barrels. And, then,
18 the produced, or, the undiscovered portion at 426
19 billion barrels.

09:36:03

20 The total discovered but not yet
21 developed and undiscovered we called the resource
22 potential, 525 billion barrels in the global
23 Arctic. We split that by country in the figure on

1 bottom right, and you can see by inference, the
2 largest portion that is attested to be present in
3 Russia.

09:36:27

4 But, considering just oil, the U.S. and
5 Russia have roughly equivalent amounts. And, the
6 U.S. global, or, the U.S. oil potential is similar
7 to Russia and bigger than Canada, Greenland, or
8 Norway.

09:36:44

9 When we consider the global potential
10 and the U.S. potential, about 75 percent is in the
11 offshore, which illustrates why we focused our
12 technology assessment in offshore technologies.

09:37:13

13 If I direct your attention to the second
14 black bullet in this finding in the report, we
15 address the question of why to pursue the Arctic
16 now, when it's remote, costly, and current, with
17 current oil prices and current Lower 48 production.

09:37:27

18 And, the answer to that, in summary, is
19 the long lead times needed to pursue this
20 opportunity. An Alaska offshore development would
21 take more than 20 years, 20 to 40 years to
22 progress.

23 And, if you intersect that timeline with

1 the forecast of decline of the Lower 48, you can
2 see that, in order to continue to maintain U.S.
3 production at current levels, we're going to need
4 the Arctic to do that.

09:37:46

5 And, then, finally, as Rex outlined,
6 pursuing this opportunity has national security
7 benefits, energy security benefits, and economic
8 benefits. And, in the report we identify this the
9 significant benefits of oil-and-gas actively today,

09:38:04

10 identifying that the oil-and-gas industry is
11 roughly one-third of Alaska's economic activity,
12 and supports one-third of Alaska's jobs.

09:38:18

13 And, then we cite the potential impact
14 of an offshore development on Alaska, the local
15 economies, and the Nation.

09:38:33

16 Turning our attention to Finding 2 on
17 the Arctic Environment, in the wording of the
18 Finding, and the first bullet, we speak about how
19 much is known about the Arctic environment after
20 decades of research.

21 In Finding 2 we identify that the
22 characteristic that distinguishes the Arctic from
23 other oil-and-gas operating areas is the presence

1 of ice. And, there's significant variability in
2 ice and Arctic conditions around the world.

09:38:56 3 The most important characteristics of
4 this ice are the type of ice, the water depth, and
5 the open-water season. And, I'll say more about
6 this in a couple of slides.

7 That variability is illustrated in the
8 pictures on the bottom of the slide. On the left
9 you see a picture of first-year ice taken offshore
09:39:12 10 off an Arctic island.

11 First-year ice reaches a thickness of
12 about 1.5 to 2.8 meters each year it freezes. And,
13 then, in the middle you see an example of
14 multi-year ice.

09:39:26 15 This is an ice ridge taken in the
16 Canadian Beaufort Sea. Ice ridges are formed when
17 first-year ice is compressed into sheets by wind
18 and it refreezes.

19 These form the dominant features that
09:39:50 20 affect ice-breaking activities, et cetera, in the
21 winter months.

22 And, then, finally, on the right we see
23 a picture off of eastern Canada in Arctic-like

1 conditions with an iceberg, a significantly sized
2 iceberg. Icebergs are very rare in the U.S., but,
3 like this picture illustrates the open water that's
4 available in so much of the Arctic regions.

09:40:28

5 And, with the open-water environment,
6 obviously, deep-water technologies could be brought
7 to bear, even though there's ice present.

09:40:45

8 In, in the black Bullet Number 3 we
9 identify that experiences from other remote an
10 challenging oil-and-gas areas are applicable, and
11 in the report we highlight deep-water technologies,
12 for example, in terms of design practices and
13 safety systems having direct applicability.

09:41:35

14 And, we also identify some of the
15 logistics challenges associated with recent
16 development associated with West Africa and Papua
17 New Guinea, just to give you a couple of examples.

09:41:49

18 And, then, finally, we acknowledge, with
19 regard to the environment, that the climate is
20 changing, and that there are additional monitoring
21 opportunities associated with that changing
22 climate, with the focus on the interaction of key
23 species with ice and oil-and-gas activities. And,

1 we'll say more about that when we get to the
2 Recommendations.

3 Turning our attention to Finding Number
4 4, Finding Number 3, we identify the long history
09:42:16 5 that the industry has had enabled by technology
6 advances. And, this particular chart focuses on
7 the offshore, and starts in the '60s.

8 But, as Mr. Tillerson mentioned, the
9 oil-and-gas industry's activities began onshore in
09:42:31 10 Norman Wells, Canada, in the 1920s. This
11 particular graphic illustrates the significant
12 technology advances that have enabled the
13 operations, beginning in the 1960s through the late
14 '70s, with the focus on near-shore exploration in
09:42:49 15 varying, in varying ice conditions, and focusing on
16 exploration, and, then, in the late '70s through to
17 the late '90s, stepping into deeper water further
18 away from shore, still less than 100 meters, with
19 buried ice, again focusing on exploration.

09:43:09 20 And, you can see highlighted the
21 significant stepouts in terms in terms of the
22 exploration technology and drilling shifts that was
23 advanced. And, then, finally, beginning in the

1 late 1990s through to the present day, stepping out
2 into deeper water and moving from development to
3 exploration.

09:44:36 4 So, throughout the, the technology
5 stair-step figure you can see the significant
6 enabling technologies that opened up more and more
7 challenging environments. And, we would expect
8 this to continue.

09:44:51 9 Turning our attention to Finding Number
10 4, this slide describes why we assert that the U.S.
11 potential is developable today. And, this slide
12 represents five tiers of physical environment found
13 in the global Arctic.

09:45:10 14 And, each role on the slide represents a
15 different technology challenge for exploration and
16 development. The first two columns describe the
17 physical environment and give examples.

09:45:24 18 And, by "physical environment," I mean
19 ice type, length of open-water season, and water
20 depth, as we described two slides previously. You,
21 you can think of it as the first row as the easiest
22 tier, and the fifth row as the hardest tier to
23 develop.

1 In the third column we describe the
2 technology implications for typical practices in
3 that ice environment. And, then you'll notice
4 immediately that there are photos in, in Tier 1, 2,
09:45:45 5 and 3, and there are no photos yet in Tier 4 and 5.

6 That's because Tier 1, 2, and 3 have
7 been proven globally, and Tier 4 and 5 have not yet
8 been proven. Finally, you'll notice that the red
9 text in the center highlights the U.S. Arctic
09:46:03 10 contained entirely in Tier 2 and Tier 3 which has
11 been proven by other operations around the world.

12 Before I leave this page I thought it
13 would be helpful to just bring home the technology
14 implications of the environment by walking through
09:46:18 15 the, the photos that you see. In Tier 1 examples
16 of ice-free conditions in the South Barents in
17 eastern Canada.

18 The first photo is a photo of snow
19 subsea development in Norway. It was the first
09:46:56 20 Arctic subsea development.

21 It's 140 kilometers from shore in
22 roughly 300 meters of water depth. It was
23 discovered in 1984 and was started in 2007,

1 representing a significant technology advancement
2 in the Arctic.

3 The Hibernia Field was discovered in
4 1979 in 80 meters of water. It's developed by GBS.

09:47:18

5 In this, in Tier 2 we see examples of
6 near-shore spray-ice islands. And, the photo was
7 taken in the mid 1970s, three kilometers offshore
8 in three meters of water.

09:47:34

9 And, the Northstar Development, which is
10 an active development in the offshore Alaskan seas,
11 it's six kilometers northwest of Prudhoe Bay in 14
12 meters of water. It was discovered in 1984, and
13 brought, the oil is brought back to shore by a
14 six-mile subsea pipeline that's buried to reduce
15 the risk of damaging the pipeline due to ice scour.

09:48:39

16 And, then, finally, in Tier 3 we see a
17 photo of the Canmar 2 drill ship which was used to
18 explore in the Canadian Beaufort in the 1980s.

09:49:20

19 And, traditional exploration drilling in the summer
20 season and into the shoulder season was proven in
21 the '70s and '80s.

22 And, then, finally, we see a photo of
23 the Sakhalin-2 GBS, which is a shallow-water

1 craft-based structure that was constructed in
2 southern climates, floated in during the open-water
3 season, and sunk down on the see floor. And, that
4 forms the basis for year-round operations, which is
09:50:13 5 a typical development technology which could be
6 used in the U.S. Arctic.

7 Turning our attention to Finding 5, we
8 describe the economic viability of an Alaskan
9 development which is challenged by operating
09:50:48 10 conditions, and the need for Regulations that
11 reflect those operating conditions. In the first
12 four bullets we talk about the challenges in, in
13 the operating conditions.

14 Specifically, Arctic exploration and
09:51:00 15 development is more costly than other areas due to
16 the remoteness, the challenging climate, the short
17 operating seasons, and the infrastructure.
18 Stakeholder alignment and regulatory efficiency
19 also will influence economic viability.

09:51:14 20 And, although that may not be clear how,
21 when you think about trying to operate in a
22 relatively short operating season in the
23 summertime. If you receive a Permit Condition in

1 the middle of the summer, then you have to wait for
2 a subsequent year in order to be able to address
3 that Permit Condition, which affects schedules.

09:51:36 4 In order to make an economically viable
5 development offset these increased costs, you need
6 a discovery of sufficient size and quality in order
7 to advance it. And, as we discussed in Finding 5,
8 the majority of the potential is not yet
9 discovered.

09:51:49 10 So, pursuing exploration in the U.S.
11 Arctic is important. We found that two areas were
12 currently limiting exploration, and those are
13 illustrated on the bottom of the slide.

09:52:03 14 On the left is drilling season length.
15 Currently the practice is to limit the drilling
16 season to only the summer months when no ice is
17 present. And, in this particular example we have
18 110 ice-free days.

09:52:17 19 However, the back end of the season is
20 reserved from drilling due to the requirement to
21 drill the same-season relief well, which shortens
22 the time available to drilling to about 80 days, as
23 illustrated. This is an important factor because

1 drilling an exploration well to target takes about
2 80 to 90 days.

3 So, this current practice requires
4 multiple lease extensions to drill a single
09:52:43 5 exploration well. The bottom half of that
6 particular picture shows what could be possible
7 with validating some of the recently developed
8 technologies.

9 Firstly, accepting capping stack and
09:52:54 10 other technologies as a way to make safe the well,
11 and then potentially go back in a subsequent
12 seasons to drill a relief well would add 38 days to
13 a drilling season.

14 And, then, secondly, allowing the use of
09:53:48 15 ice management techniques such as has been used in
16 other jurisdictions would extend the drilling
17 season still further. So, in the example, you can
18 see that we could, with additional technologies,
19 extend the seasons roughly double to what it is
09:54:31 20 today, which would enable a single exploration well
21 in a single season; roughly take the cost of
22 exploration drilling in about half.

23 On the right-hand side we illustrate the

1 challenge associated with lease, lease lengths in
2 the U.S. And, we've compared the current U.S.
3 lease practices with other jurisdictions.

09:54:52 4 You can see in the second column that
5 the U.S. is unique in adopting what we called a
6 development-based system. And, what is meant by
7 that will is that in the U.S., in the primary lease
8 term, which is ten years, you've got to do seismic,
9 drill an exploration well, have a discovery, and
09:55:08 10 then do significant suf-, sufficient, and this is
11 textbook, sufficient appraisal drilling and
12 engineering studies in order to be able to take
13 your development to final, or final funding and
14 secure a secured funding in order to request a
09:55:21 15 Lease extension.

16 And, that construct works very well in
17 Lower 48 examples where you have significant
18 infrastructure. And, and the, and, the goal is to
19 encourage people not to sit on leases that could be
09:56:23 20 developed by others.

21 In the case of the Arctic, where you can
22 only work three months of the year, it's
23 particularly challenging, given the number of wells

1 that would be required. Other countries have
2 recognized this challenge, especially in an
3 underexplored area with lack of infrastructure.

4 And, their solution is to split the
09:56:46 5 Lease into an exploration phrase, and if you have a
6 significant discovery you're allowed to hold the
7 lease and then enter into a second negotiation for
8 a production Lease such as the case in Canada.

9 And, you'll see when we get to our Recommendations,
09:56:56 10 we recommend that the Department of Energy and the
11 Department of the Interior assess this lease term
12 relative to the physical constraints of doing our
13 work in the Arctic.

14 And, then, finally, yes, that's it.

09:57:07 15 Those are the key findings in the economic area.

16 In Finding 6 we talk about the need to
17 secure and maintain public confidence. And, we
18 identify in the opening remarks in this section
19 that the industry and Government have a shared
09:57:24 20 responsibility to secure and maintain this public
21 trust.

22 Both of the industry and the Governments
23 have a responsibility and a requirement to engage

1 with the local Community to understand their
2 perspectives, and how industry is working in the
3 region.

09:57:42

4 And, then, each of the industry and the
5 Government have unique roles in, in preparing and,
6 and securing and maintaining this public
7 confidence. Industry must operate responsibly, and
8 continuously improve.

09:57:55

9 And, in this section we talk about risk
10 management systems, integrated risk management
11 systems that have been developed; the recent ties
12 across the industry such as the operations
13 integrity management system of ExxonMobil.

09:58:09

14 We also talk about the ob-, the
15 obligation of industry to continually learn and
16 respond to incidents. And, in this chapter we
17 identify some significant incidents that, that
18 occurred in Arctic conditions or deep-water
19 conditions that significantly shaped this

09:58:23

20 industry's risk management culture and our
21 practices: McCondo, Piper Alpha, and Valdez, and
22 the Kulluk.

23 And, we identify that the industry and

1 Government learned from these incidents and moved
2 on. And, it's made the industry even safer today.

09:58:46 3 On the government side we acknowledge
4 and, and recognize the role to ensuring public
5 safety and environmental protection, and also
6 support development. That's the definition of
7 prudent development.

09:58:58 8 And, in this industry, in this section
9 we talk about the long history of Arctic Policy and
10 Regulations. And, we identify the significant
11 number of agencies that are involved in oil-and-gas
12 Policy and Regulations, as you see listed on this
13 slide, illustrating the need for coordination and
14 role clarity in order to be able to move forward.

09:59:13 15 In Finding 7 we discuss, finally, the
16 significant recent technology and regulatory
17 advancements in the area of oil-spill prevention
18 and oil-spill response. And, the figure on the
19 slide is called, for obvious reasons, the bowtie.

09:59:29 20 At the center of the bow is a
21 loss-of-containment event, and on the left-hand
22 side are prevention measures, and on the right-hand
23 side are response and recovery technologies. And,

1 in the report we go into quite some detail about
2 all of the different technologies that have been
3 developed and applied in order to prevent a blowout
4 from occurring in the first place.

09:59:53

5 And, immediately on the right of the
6 bowtie I'll direct your attention to the photo of
7 the capping stack and seabed shut-in devices, which
8 are knew technologies which have been developed and
9 advanced since the McCondo tragedy.

10:00:09

10 And, these, these devices have been used
11 in, in other regions, and they offer significantly
12 improved environment protection versus the current
13 practice of the same-season relief well because
14 they have the capability of stopping the flow of
15 oil in a matter of minutes or hours, versus days or
16 weeks or months, as is required.

10:00:22

17 And, so, pursuing these technologies,
18 getting these technologies accepted offer
19 significant advantages.

10:00:36

20 Turning our attention to the
21 Recommendations, I've got a summary page, and then
22 I will walk through the most important
23 Recommendations that we have in the report.

1 In the first bullet, although the
2 technology exists to explore and develop the
3 resources safely today, additional research is
4 recommended to either validate some of these
10:00:58 5 recently developed technologies for use in the
6 U.S., or to pursue technology extensions which
7 could lead to improvement.

8 And, as Rex outlined, although this is
9 not a Policy study, we do highlight some Policy and
10:01:14 10 regulatory recommendations where we have a
11 technology link; in other words, where we've
12 identified barriers in the U.S. that are different
13 than other countries that, if addressed, could help
14 prudent development of the U.S. Arctic move
10:01:28 15 forward.

16 We have a total of 32 Recommendations in
17 the Executive Summary, and, additionally, 60
18 research Recommendations in the report. And, these
19 Recommendations are grouped into themes:
10:01:38 20 Environmental stewardship, Economic Viability, and
21 Government Leadership and Policy Coordination.

22 And, I'll step through each of these
23 now. Regarding the environmental stewardship

1 theme, the first recommendation is that industry
2 regulators and, and other stakeholders should work
3 together to perform the analysis, investigations,
4 and any necessary demonstrations to validate the
5 technologies for improved well control.

10:02:07

6 The most important of those technologies
7 are pictured on the bottom of the slide, a subsea
8 isolation device, and a capping stack device.

10:02:23

9 Secondly, government agencies should
10 participate in the ongoing and any future industry
11 collaborative research programs for oil-spill
12 response in ice such as the current Arctic Response
13 Technology JIP, which has been underway since 2012.

10:03:01

14 In particular, we are interested in the
15 Department of Interior's organization joining this
16 collaborative research, as they've spent quite a
17 lot of money and time investigating oil-spill
18 response in ice.

10:03:14

19 They've got some data to bring to the
20 table, and, in addition, they, they fulfill an
21 independent role, versus the industry. So, we
22 would be pleased to have the Department of Interior
23 join this effort.

1 And, then, finally, in the area of the
2 environmental stewardship, on, on this page,
3 regulators should continue their evaluation of
4 oil-spill response technologies in Arctic
10:03:36 5 conditions, and consider all different response
6 options, and potentially do the research necessary
7 to pre-approve those options.

8 Currently in the Regulation there is a
9 device for mechanical recovery, and in the event
10:03:50 10 of, in the event of an event, one needs to move
11 quickly, potentially considering other options that
12 may have better environmental performance, given a
13 particular situation such as disbursements and in
14 situ.

10:04:21 15 So, we recommend that research be done
16 now, and pre-approval be considered in order to, to
17 be swift when we need to.

18 On the next page we continue in the
19 environmental stewardship theme, and we turn our
10:04:36 20 attention to ecology. The, the ecological
21 environment in the Arctic is very well-understood.

22 We understand the key species that are
23 there. And, some of the population, specifically

1 the marine mammals, are among the most well-studied
2 in the world.

3 However, there are, there is a need for
4 additional research on long-term population
10:04:59 5 estimates, and the understanding of the impact of
6 oil-and-gas activities and the changing climate on
7 key species, notably Arctic cod, ice seals,
8 walruses, and polar bears.

9 The specific -- Right now the
10:05:14 10 environment is protected by a Conflict Avoidance
11 Agreement, for example, that the industry engages
12 in to limit activities when marine mammals are
13 present, or when subsistence hunting activities
14 are, are underway.

10:05:31 15 But, the thought is that we could be,
16 provide better environmental protection and more
17 flexibility for operations with better data.

18 In the area of collaboration and
19 coordination of ecological and human environment we
10:05:46 20 noted in our findings the significant amount of
21 research being done in this area by a number of
22 different organizations. And, the biggest
23 opportunity is to provide a vehicle for each

1 research organization to know what the others are
2 doing.

3 And, in the area, in the area of
4 ecological research, we note the significant
10:06:05 5 efforts of North Slope Science Initiative. And, we
6 also note that the North Slope Science Initiative,
7 as part of their mandate, has a responsibility to
8 coordinate human environment research.

9 However, this organization has currently
10:06:20 10 only about one to one and a-half people working on
11 it, and they don't have social-science capability.
12 So, we recommend that that be addressed in order to
13 enable the NSSI to continue their good work in
14 collaboration and to the social sciences.

10:07:09 15 And, then, finally in the area of
16 social, socioeconomic impact assessments, in the
17 U.S., this the part of the environmental impact
18 assessment. And, the structure around the
19 socioeconomic impact assessment is quite, there's
10:07:22 20 not a lot of structure to it.

21 And, we felt like updating it in order
22 to provide more structure would enable more
23 efficiency and collaboration, particularly in the

1 area of sharing baseline data. And, we make some
2 recommendations in that regard.

3 Considering economic viability, the
4 first two bullets address the issues that I
10:07:46 5 outlined in the economic viability finding. In the
6 first bullet we recommend industry, Government, and
7 Regulators work together to validate technologies
8 and capable, capabilities necessary to extend the
9 drilling seasons.

10:08:02 10 And, I illustrated in my discussion of
11 the findings of how important this Recommendation
12 is in promoting exploration.

13 In the second bullet, we speak, we
14 recommend that the Department of Energy and the
10:08:14 15 Department of the Interior work together to assess
16 typical timelines required for antarctic
17 development compared with the current lease terms
18 and lease terms and conditions in other
19 jurisdictions.

10:09:09 20 And, then, with the results of this good
21 research, that could inform policy decisions and
22 regulatory decisions as warranted.

23 And, then, finally, we recommend that

1 Policy, Regulations, and implementation encourage
2 innovation and enable the use of technology
3 advances.

10:09:51

4 And, the Department of Interior has some
5 capability in, in this regard, but, for an
6 individual Regulator, there's significant risk in
7 exercising this flexibility. And, we make
8 recommendations in the report for Arctic training
9 to enable the use of this flexibility that already
10 exists.

10:10:05

11 And, then, in the third theme, the third
12 and final theme, government leadership and policy
13 coordination, we consider domestic leadership, and
14 then recommendations for the Arctic Council.

10:10:19

15 So, Slide 19, regarding -- We note the
16 Arctic Executive Steering Committee just recently
17 formed by Executive Order. We think that's a
18 significant step, suggesting coordination of 22
19 federal agencies at the Deputy Secretary level,
20 which we think will be a sea change in
21 coordination.

10:10:38

22 And, we make recommendations for that
23 initial body as it gets formed the commit, reaffirm

1 a commitment to prudent Arctic oil and gas
2 development, assess alignment across federal
3 agencies with regard to that objective, and then
4 clarify the process with which it will engage with
10:11:00 5 Alaskans.

6 We, we also note the Arctic Executive
7 Steering Committee has, as part of its requirement,
8 a gap analysis that's due in May, and we, we make
9 some recommendations that the Executive Steering
10:11:15 10 Committee should consider as part of that gap
11 analysis, those being a comprehensive and
12 integrated list of regulatory requirements, and
13 then an assessment.

14 The Interagency Working Group is doing a
10:11:27 15 great job of coordinating Permit Requirements in
16 the Arctic, and we thought that that Group, in
17 particular, could have some insight into the
18 difficulties of setting up a coordinating body in
19 some of the areas for improvement.

10:11:56 20 And, we recommended that the Arctic
21 Executive Steering Committee talk to that Group for
22 some of their insights as part of that gap
23 analysis.

1 And, then, finally, regarding the
2 Department of Energy's participation in the, in
3 that group, we make some recommendations that we
4 thought would better facilitate the Department of
10:12:14 5 Energy's participation.

6 Considering the Arctic Council prior to
7 the U.S. chairmanship the Arctic Council has
8 entered symbol into international Agreements on the
9 important topics of search and rescue in 2011, and
10:12:48 10 oil pollution preparedness and response in 2013.
11 These are very important topics, and if there's an
12 incident in the Russian Arctic, the U.S. Arctic, or
13 Canadian Arctic, they enable cross-bord-,
14 cross-border collaboration.

10:13:18 15 So we're moving now into response
16 exercises. And, upcoming, the Arctic Council plans
17 a desktop exercise first, and then a field
18 exercise.

19 And, the industry has a lot of
10:13:29 20 experience in response, safety and response, and so
21 we would like to engage and participate in that.

22 And, then, finally, the Arctic Economic
23 Council is a relatively new body that's just been

1 formed, and we recommend that the Arctic Council
2 strengthen the interaction with the Arctic Economic
3 Council as a vehicle to provide business
4 perspective, as well as environmental perspective,
10:14:20 5 to the Council.

6 Turning our attention to my fourth
7 agenda topic, which is where we go from here,
8 subject to the Council's comments and, and
9 approval, we are ready to turn the digital
10:14:41 10 communications live this afternoon. You can see a,
11 a photo of the report cover on the right-hand side.

12 There will be a digital copy of the
13 Executive Summary, and there will also be other
14 related materials available. The Council webcast
10:15:00 15 will be available.

16 There will be a schedule of forward
17 events, and I'll say more about that in a second.
18 And, then, finally, at the suggestion of the Study
19 Committee, we worked with the National Petroleum
10:15:11 20 Council to think about how we could update our
21 communications to make them more social-media
22 friendly.

23 And, so, you can see right at the bottom

1 of the slide, the NPC now has a Twitter account.
2 So, for those of you that are active in, in
3 Twitter, you can, you can follow and, and hear some
4 great insights from, from Marshall Nickolson
10:15:33 5 (phonetic), and his team.

6 We are making great progress in making
7 our printed version available. I'm, I'm very
8 pleased with the, with the initial typeset version
9 of the Executive Summary.

10:15:47 10 We are, indeed, in a great spot, and our
11 printers have told us that the printed volume of
12 the Executive Summary will be available in
13 mid-April, and the full report will be available by
14 the end of May.

10:16:06 15 And, then, finally, on the, on the last
16 slide, just a little bit about communications.
17 Yesterday, prior to, to the meeting, Mr. Hillardson
18 (phonetic) and, and Ms. Sherwood-Randall held five
19 briefings with Senate, White House, and House
10:16:17 20 leaders in order to provide a, a perspective on the
21 report so they would be ready to receive it.

22 We also provided some pre-briefing with
23 the staff to tell them about the report in the

1 interest of, of getting the word out that, that
2 this was coming. And, then, subsequent to,
3 hopefully, the, the approval here today, we have
4 plans to travel to Alaska to meet with some of the,
10:16:38 5 the State leaders and the community leaders in the
6 first week of April.

7 The CFC lead team will be making that
8 trip. CSIS has volunteered to host a panel
9 discussion in Washington on April seventeenth, and
10:16:54 10 we look forward to that public event.

11 Other Washington and Alaskan
12 communications are going to be conducted during
13 April. And, we've also made a commitment to
14 participate in the Energy Council meeting in Santa
10:17:10 15 Fe in June with potentially a panel discussion.

16 And, I, I believe there's also an event
17 hosted at RFI Resources for the future on April
18 first, coming up. So, we will continue to receive
19 questions for communications, and then they will
10:17:26 20 continue to be noted and, and followed up on by
21 staff.

22 After we get through the initial
23 rollout, there's a protocol for ongoing

1 communications which I've highlighted. Any
2 individual can use the NPC Arctic Research Report
3 and express their own views, provided they'd cite
4 the report.

10:17:48

5 And, if the request does not originate
6 through the NPC, please let John Guy at NPC, of NPC
7 know of the request, provide the name of the
8 presenter and a copy of the presentation or the
9 report, and, please be mindful of the purpose of
10 the Council and the prohibition against lobbying.

10:18:23

11 Post the, post the meeting we will have
12 available these slides and some shorter versions of
13 the presentation for your potential use as you move
14 forward and make your own presentations in that
15 regard.

10:18:59

16 Once again, thank you very much to my
17 team, and thank you to the Council for your support
18 for this opportunity, and for your time and
19 attention this morning.

10:19:08

20 Mr. Tiller son?

21 (Whereupon, applause was had.)

22 MR. TILLERSON: Do we have this
23 microphone on? Thanks.

1 So, in keeping with suggestions at the
2 last Study Committee meeting that we, we kind of
3 live a little more up-to-date with our modes of
4 communication, it was also suggested that we
10:19:41 5 investigate producing a, a rollout YouTube video,
6 which we have done.

7 And, if we have it loaded, we thought we
8 would play that for you so you can see what's out
9 there, or will be out there as of today.

10:19:55 10 (Whereupon, a YouTube video was played:)

11 National Petroleum Council was
12 established in 19346. The Council is a privately
13 funded advisory committee to the Secretary of
14 Energy.

10:20:14 15 We operate under the Federal Advisory
16 Committee Act. From the beginning to this day, the
17 sole purpose of the Council has been to provide the
18 advice of the members, upon the request of the
19 Secretary, to the Federal Government on any matters
10:20:27 20 relating to oil and gas or the oil-and-gas
21 industries.

22 We receive no government funds, and when
23 studies are established, we will pay for those

1 costs from funds provided by the members. The
2 Council is not an advocacy group.

3 It is not involved in any of the usual
4 trade-association activities, and it does not
10:20:47 5 lobby. The Arctic Research Study is being
6 undertaken by the National Petroleum Council to
7 address questions regarding what research and
8 technologies would help provide support for prudent
9 development of our Arctic oil and natural-gas
10:21:03 10 resources.

11 The Arctic region is the world's largest
12 potential for undiscovered potential oil and
13 natural gas. It's been a very collaborative effort
14 across federal agencies, and people in the State
10:21:15 15 Office, labs, and the industry, to bring together
16 all of the expertise and experience we have in
17 operating oil-and-gas development in that region.

18 What excites me about this report is the
19 collaboration. It really brought together a wide
10:21:31 20 spectrum of experience, not only from the energy
21 companies, but from the think-tank community,
22 environmentalists, experts, academics.

23 It brought us all together to try to

1 figure out the question: How can we safely and
2 responsibly and prudently develop the American
3 Arctic? What are the obstacles?

4 What are the opportunities? How does
10:21:55 5 that impact indigenous communities to realize the
6 promise presented by our domestic oil-and-gas?

7 Research of the Arctic will require that
8 we continue to develop and demonstrate technologies
9 and practices that allow the public to have
10:22:39 10 confidence that the resources can be developed in a
11 prudent manner, and many of those important steps
12 are pointed out in this study.

13 The industry has a very long history of
14 development in the Arctic, and the Arctic is an
10:22:47 15 important source of supplying natural gas and oil
16 to the world's energy needs today.

17 Essentially we've seen continued
18 actively from the 1820s to almost the 2020s. So,
19 we've considered safety, human health,
10:23:02 20 environmental stewardship, sustainability in
21 balance with economic growth.

22 This document is going to go to the
23 Secretary of Energy. There's a lot of balancing

1 interests.

2 There's the balance between conservation
3 and resource development. There's the balance
4 between traditional knowledge and what we call
10:23:34 5 Western science and engineering.

6 Traditional knowledge is an important
7 aspect of operating successfully and responsibly in
8 the Arctic. First of all, you have to recognize
9 that the people of the Arctic have been there for
10:24:09 10 thousands of years, with a, a very close
11 relationship with the environment that they, they
12 live in.

13 Recognition that they have this
14 knowledge, and gaining the ability to, to access
10:24:23 15 that knowledge and utilize it to improve our
16 understanding is an important aspect of, of being
17 successful.

18 And, we did a lot of work to try to
19 listen to those points of view and concerns. And,
10:24:34 20 when you look ultimately at the report, I think
21 most people will see there's an enormous amount of
22 information that is responsive to those ideas,
23 those suggestions, and even some of their

1 recommendations.

2 There are three findings which I'd
3 highlight as most significant. Firstly, there's
4 substantial resource potential in the Arctic, both
10:24:55 5 globally and in the United States.

6 Secondly, this U.S. potential can be
7 explored for and developed safely while maintaining
8 environmental stewardship using existing
9 field-proven technology.

10:25:38 10 Finally, there have been substantial
11 recent technology improvements in the area of
12 oil-spill prevention and oil-spill response in the
13 ice.

14 The Arctic is our home. We're not going
10:25:51 15 anywhere.

16 And, so, if development comes to our
17 area, we want to benefit from it while it's there,
18 and we want to make sure that we mitigate any
19 negative impacts that might happen. Do we get
10:26:03 20 passionate about it? You bet we do.

21 (Whereupon, the YouTube presentation
22 ended. The following occurred in open
23 proceedings:)

1 MOTION TO ACCEPT REPORT

2 MR. TILLERSON: Okay. So, Mr. Chairman,
3 at this point I would move adoption of the
4 Council's Arctic Research Study, and would welcome
10:26:24 5 any discussion from the Council members, comments
6 or questions that Council members may want to raise
7 during this portion of the consideration.

8 THE CHAIR: Thanks, Carol. What a great
9 job.

10:26:43 10 You and the Study Groups have assembled
11 a very comprehensive report, and I'm, I am pleased
12 that we've, that you've taken on the, the challenge
13 of, of finding a different way to communicate the
14 results. I think that video, which, by the way,
10:26:57 15 was done very quickly.

16 It was in the last Committee meeting
17 that it was suggested. So, true to Council's form,
18 we can move quickly.

19 And, it's a, really, a, a nice
10:27:08 20 additional way to communicate the results of this
21 study.

22 I do have a Motion that the National
23 Petroleum Council approve the report, subject, of

1 course, to final editing and approve the
2 transmittal letters to Secretary Moniz, and make
3 available to the public through the NPC web site.

10:27:29

4 Before we have a discussion could I have
5 a second on this Motion?

6 A MEMBER: Second.

7 THE CHAIR: Thank you.

10:27:36

8 So, at this point are there any comments
9 or questions from the Council members on the
10 proposed final report? We've got some microphones
11 available if you'd like to have questions.

12 I think we're seeing -- Aah, right.
13 Marvin. Yes.

14 Yes, right here in front.

10:27:58

15 MR. ODUM: So, just a comment to, to
16 also, you know, on behalf of, I know, a number of
17 people, is a thank-you and congregations on what I
18 think is a terrific study. I think there was an
19 enormous need for a comprehensive look at this
20 topic, and this provides a great source for the
21 many stakeholders that are in this, in this area.

10:28:14

22 And, so, it's, it's just a voice of
23 support.

1 THE CHAIR: Thank you. Thank you.

2 Any other comments? Yes, sir?

3 (Whereupon, no response was had.)

4 THE CHAIR: Okay, we have a Motion and a

10:28:33 5 Second to adopt the Proposed Final Report on the

6 NPC Committee on Arctic Research. All those in

7 favor, say, "Aye."

8 (Whereupon, a response was had.)

9 THE CHAIR: Are there any opposed?

10:28:43 10 (Whereupon, no response was had.)

11 THE CHAIR: The report is adopted

12 without objection. And, once again, thank you,

13 Rex.

14 Thank you, Carol, who's smiling widely

10:28:56 15 right here. And, members of the Committee, Chairs

16 of the Subcommittee and Subgroups, multitude of

17 volunteers that have helped complete this work.

18 This, this report does provide a very

19 significant amount of information to policy-makers

10:29:11 20 as they deal with near-term issues at hand, as well

21 as many of the long-term issues that need to be

22 addressed now as we go forward.

23 It's going to be an important resource,

1 to those who are students of the Arctic and those
2 who will be dealing with Arctic development issues
3 around the pan-Arctic region.

4 And, I would just, as a side note,
10:29:34 5 comment that this now concludes two requests of the
6 Secretary had before the National Petroleum
7 Council, the first which we approved last December
8 with -- Marvin Odum led the group on emergency
9 preparedness, and now this one on Arctic research.

10:29:52 10 And, I think what strikes me, in
11 stepping back and looking at both of these reports,
12 is they really demonstrate the value added the
13 National Petroleum Council provides to not only the
14 Secretary of Energy, but, really, to this Country,
10:30:07 15 because this is a very unique organization.

16 When you think about the report that we
17 just approved that involved 250 members, over 90
18 organizations, it's hard for me to really find an
19 equivalent organization that can pull together such
10:30:24 20 a comprehensive report on a diverse set of topics
21 such as emergency preparedness or the Arctic, do
22 those virtually in parallel, and produce very
23 comprehensive, incredible results that reflect the

1 opinions and inputs of a diverse cross-section of
2 our industry.

3 So, I think it's, we should all be proud
4 of our involvement in National Petroleum Council,
10:30:51 5 and to really see here today demonstrated what we
6 can do to help energy development, and to make
7 informed advice to the Secretary of Energy
8 regarding energy issues.

9 So, Madam Deputy Secretary, it's with
10:31:06 10 great pleasure that the National Petroleum Council
11 submits this report to you in response to the
12 Secretary's request. The effort went into it, I
13 won't repeat all the, the specifics, but,
14 obviously, many, many organizations.

10:31:21 15 So, it's with great pleasure to present
16 this to you, which brings us to an opportunity to
17 hear from you.

18 So, it's with great pleasure that I
19 introduce Honorable Elizabeth Sherwood-Randall.

10:31:42 20 Hon. DEPUTY SECRETARY SHERWOOD-RANDALL:
21 Good morning.

22 And, thank you, Chuck.

23 Thank you, Rex.

1 And, Carol.

2 And, Marshall

3 And, the entire NPC.

4 I would love to have everybody who was
10:31:52 5 involved in writing this report stand up and
6 receive a round of applause if you're in this
7 audience. Please.

8 Tremendous work. Thank you.

9 (Whereupon, applause was had).

10:32:09 10 Hon. DEPUTY SECRETARY SHERWOOD-RANDALL:
11 I also want to thank our District Team at DOE, led
12 so ably by Paula Gant and Nancy Johnson. Nancy, I
13 see you there, too. Thank you so much.

14 As you know, Secretary Moniz did plan to
10:32:23 15 be here today. We worked very hard to protect this
16 date on his calendar, but two things converged and
17 we didn't think about it when we were working to
18 set the dates in the, the Iran negotiations process
19 that we would be in the end game.

10:32:40 20 One of the deadlines is this weekend,
21 and the President and the Secretary of State asked
22 the Secretary of Energy to join the negotiations.
23 As you know, his expertise is as a nuclear

1 physicist, and it absolutely serves all our
2 interests that he should be in Switzerland today,
3 and that I should be holding the flag for him here.

4 He and I both deeply appreciate the
10:33:06 5 truly excellent work that has been done in response
6 to his October, 2013, request to the NPC. And, as
7 Rex noted, in the context of the president's then
8 newly released national strategy for the Arctic
9 region, Secretary Moniz asked that you provide
10:33:26 10 advice on what research the Department of Energy
11 should pursue, and what technology challenges need
12 to be address to ensure prudent development of
13 Arctic oil and gas resources while advancing U.S.
14 energy and economic security, and ensuring
10:33:55 15 environmental stewardship.

16 The study's recommendations align with
17 the Department of Energy's mission. The priorities
18 identified in the President's 2013 strategy, and
19 the president's all-of-the-above approach to
10:34:10 20 developing new domestic energy supplies, and the
21 recommendations will inform the Department's
22 research agenda going forward, in particular, as we
23 set priorities for our national laboratories that

1 do cutting-edge research in spill repression,
2 operational risk assessment, and climate and ocean
3 modeling.

4 So, on the Secretary's behalf, I am very
10:34:36 5 pleased to accept this extremely timely report.

6 And, I want to thank the Committee, again, for the
7 herculean efforts and extraordinary perspectives
8 that everyone has contributed to its completion.

9 So, to begin, I want to underscore the
10:34:54 10 importance of the work that we've done together on
11 the Arctic, and illustrate the broader context of
12 U.S. and international activities there, something
13 I've had the opportunity to talk about at some
14 length with Rex as we've met over the course of the
10:35:33 15 development of this report.

16 For many reasons, the Arctic will be a
17 growing geostrategic importance over the years to
18 come. With our warming climate that makes the
19 region increasingly accessible, this report
10:35:50 20 highlights the need for U.S. decision-makers in the
21 public and private sectors to think and act
22 strategically about the Arctic region.

23 This report will help provide the

1 substantive basis for action. United States is an
2 Arctic nation with broad and fundamental interests
3 in the region where we seek to meet our national
4 security needs, develop our economic opportunities,
10:36:18 5 protect our environment, responsibly manage our
6 resources, support scientific research, and
7 strengthen international cooperation on a wide
8 range of issues.

9 The actions we take now will greatly
10:36:34 10 affect our energy security, our economic security,
11 and our national security far into the future. We
12 need to recognize both the risks and the
13 opportunities presented by a changing Arctic,
14 especially as we are poised to take a new
10:36:50 15 leadership role in the region on April twenty-fifth
16 as Chair of the Arctic Council.

17 As you know, warming in the Arctic has
18 dramatically changed the environment, driving a
19 decades-long retreat of sea ice. The National Snow
10:37:08 20 and Ice Data Center identified February
21 twenty-fifth, 2015, as the annual maximum extent of
22 sea ice for this winter, which occurred 15 days
23 earlier than usual.

1 The 5.61 million square miles of sea ice
2 is 4,010, 425,000 square miles below average, and
3 the lowest in the satellite records dating back to
4 1979. I'm going to show you a short video from
10:37:55 5 NASA to illustrate how the ice pack has retreated
6 and thinned in recent years.

7 (Whereupon, a silent video was played,
8 after which the following occurred:)

9 Hon. DEPUTY SECRETARY SHERWOOD-RANDALL:

10:38:26 10 The result of this warming is a new frontal tier,
11 with increasingly accessible resources. U.S.
12 Geological Survey estimates the Arctic holds 25
13 percent of the world's undiscovered oil and natural
14 gas resources, as Rex noted. Rare-earth mineral,
10:39:00 15 iron, and copper resources are also abundant.

16 Arctic shipping lanes, such as the
17 northern sea route along the Russian coast, can
18 dramatically shorten the distance between China and
19 Europe. We've already seen shipping on the North
10:39:37 20 Sea route rise from just five cargo ships in 2009,
21 to 71 ships in 2013.

22 Increased access to these resources
23 invites both opportunity and risk: Opportunity to

1 develop new resources, and faster routes to bring
2 them to market; and risks that competition for
3 resources could create new international tensions;
4 or, that development could result in environmental
10:40:05 5 degradation in one of the last truly pristine
6 places on earth.

7 As it has become easier to get to the
8 Arctic, and as global understanding of the
9 resources there has grown, many nations have
10:40:20 10 accelerated their engagement in the region. This
11 increased activity places a spotlight on the
12 growing importance of the region to Arctic nations
13 like ours, and to the world more broadly.

14 We've also witnessed increasing global
10:40:35 15 business interests in the Arctic, whether for
16 energy exploration, mining, fishing, or tourism.
17 Earlier this month Finland hosted an Arctic
18 business forum examining global opportunities in
19 the Arctic which drew in participants from many
10:41:06 20 non-Arctic countries, like Japan and Germany, who
21 also see growing possibilities for collaboration
22 and investment in partnership with Arctic nations.

23 Russia's significant efforts to advance

1 oil exploration in the Arctic include the
2 development of the Prirazlomnoye Field, which is
3 the first project involving oil extractions on the
4 Arctic Shelf using a fixed platform.

10:41:32

5 Production from this field started in
6 2013. China is also making new investments in the
7 Arctic both for scientific research and for
8 business interests.

10:41:48

9 And, in 2013, Russia's Rosneft and the
10 China National Petroleum Corporation signed a
11 Partnership for Energy Exploration in the Pechora
12 and Barents Seas. Many countries are upgrading
13 their ability to operate in extreme Arctic
14 conditions, with Canada starting production of new
15 Arctic offshore patrol ships operations and
16 investing in other military training and equipment.

10:43:11

17 Both China and Russia are increasing
18 their icebreaker fleets, and Russia has also made
19 headlines recently with the opening of its new
20 Strategic Military Command in the Russian Arctic,
21 and, the extent of exercise by the Russian Navy's
22 North Fleet earlier this month.

10:43:28

23 The investments made by Arctic nations,

1 universities, and companies like those in the room,
2 whether independently or with international
3 partners, is critical to improve our ability to
4 both understand, protect, and operate safely in
10:44:15 5 Arctic conditions, and to adapt as those conditions
6 change.

7 The NPC study identifies opportunities
8 for even more public/private collaboration. The
9 United States has, of course, become active, as
10:44:31 10 well, over the course of the Obama Administration.

11 In 2012, I traveled with Secretary of
12 State Clinton to Trondheim, Norway, to meet with
13 regional leaders and discuss Arctic research,
14 climate change, and strategic issues. We heard
10:44:48 15 from our colleagues in the region about the
16 leadership role the United States needs to play in
17 the Arctic alongside our Arctic Council partners.

18 The next year, in 2013, the President
19 issued the National Strategy For the Arctic Region,
10:45:03 20 and followed up with an Implementation Plan in
21 2014, in January of 2014.

22 And, as I mentioned earlier, beginning
23 next month, the United States will chair the Arctic

1 Council for two years. This provides us with a
2 unique opportunity to advance our broader strategy.

3 In addition, on January twenty-first,
4 2015, the President signed a new Executive Order on
10:45:31 5 enhancing coordination of national efforts in the
6 Arctic. As Carol noted, this Order sets up an
7 Executive Steering Committee led by the White House
8 and composed of Deputy Secretaries across the
9 Administration.

10:45:46 10 This Committee will advance the
11 implementation of our new Arctic strategy, provide
12 guidance on our priorities, and address areas where
13 agency responsibilities overlap or have gaps. This
14 Steering Committee met for the first time on
10:46:21 15 February twentieth.

16 It will provide a high-level mechanism
17 for Arctic Policy development across the
18 government, including on energy, on the
19 environment, on the economy, and on national
10:46:31 20 security. And, it will enable us to better engage
21 with international partners as the United States
22 takes the chair of the Arctic Council.

23 So, as you can see, this is a pivotal

1 moment for American and international policy in the
2 Arctic. I expect that the report that the NPC is
3 presenting to us today will prove very useful as we
4 chart our strategy for prudent development and
10:46:55 5 international cooperation in the Arctic in the
6 years ahead.

7 I want to express again our deep
8 appreciation for the very hard work that went into
9 preparing this report, and emphasize our intent to
10:47:23 10 study the recommendations very carefully. The
11 study's recommendations point to the important role
12 of the Department of Energy can play in a number of
13 ways, the most important of which is to bring to
14 bear the science that will enable the public to
10:47:36 15 have confidence that Arctic oil and gas resources
16 can be prudently developed.

17 In order for the public to have
18 confidence in the results of research, it must be
19 conducted in a transparent manner in the public
10:47:49 20 interest, and that's what we do at the Department
21 of Energy across our 17 national laboratories.

22 Through that unique network of
23 capability, through private/public partnerships,

1 and in collaboration with leading academic
2 institutions, DOE's research capabilities draw on
3 deep knowledge and expertise in ways that can give
4 regulators confidence that they can rely upon the
10:48:32 5 findings to inform policymaking.

6 In doing so, all of us in the room can
7 contribute to realizes the potential economic,
8 energy, national security, and environmental
9 stewardship benefit, benefits that can prove to
10:48:49 10 Alaska, the people's of the North, and the Nation.
11 In so doing, we'll contribute to the U.S.
12 leadership in the region for decades to come.

13 Let me describe the four areas in which
14 we will provide a response to the recommendations
10:49:10 15 in the report. First, we will provide science and
16 technology research.

17 We already have research underway in
18 spill prevention and source control to advance our
19 understanding of how best to manage and reduce
10:49:36 20 risks s. Our national labs, such as the National
21 Energy Technology Lab and the Los Alamos National
22 Lab, offer expertise that can be deployed to
23 address Arctic challenges.

1 For example, DOE has expertise that can
2 help reduce geologic uncertainty with a detailed
3 knowledge of geologic formations. Knowing their
4 rock properties, a well operator can reduce the
10:50:11 5 risk of encountering unexpected geologic hazards,
6 thereby increasing the safety of offshore drilling
7 activity.

8 The DOE Fossil Energy Research and
9 Development Portfolio addresses this issue to
10:50:25 10 improve geologic data, data acquisition methods,
11 and lock in advanced modeling capabilities to
12 improve data interpretation.

13 One previous project we completed was
14 designed to improve existing models using seismic
10:51:00 15 technology. DOE conduct, conducted acoustic
16 modeling of the Gulf of Mexico, and produced a
17 model to compare other data interpretation methods
18 against the findings, and in so doing, improved
19 predrill planning and safety.

10:51:10 20 This is the kind of research that we
21 will build upon going forward as we look at
22 opportunities in the Arctic region.

23 Second, DOE conducts integrated

1 analysis. As you know, the Quadrennial Energy
2 Review is in progress, looking at infrastructure
3 needs of our nation as they relate to energy.

4 Growth and infrastructure are
10:52:30 5 intertwined, both supporting and depending on one
6 another. DOE's expertise can contribute to
7 technical analysis needed for prudent development
8 of Arctic oil and gas resources.

9 In addition, there is work underway on
10:52:55 10 issues like drilling and completion where we're
11 examining how construction materials, technologies,
12 and best practices can be optimized to improve
13 safety while drilling, and to increase the
14 long-term reliability of a well.

15 NETL and Los Alamos risk assessment
16 research can help determine key parameters and
17 conditions that can lead to loss of well control
18 after a hit, meaning that this research can help
19 better predict kicks and prevent oil spills.

10:53:47 20 Third, DOE contributes, as it's been
21 noted, to U.S. Government-wide Policy development.
22 The newly established -- The newly established
23 Arctic Executive Steering Committee on which I

1 serve will be the principal vehicle for developing
2 Arctic Policy on the -- Sorry. -- for developing
3 policy on the Arctic Region.

4 We'll bring to bear the results of
10:54:43 5 research and analysis provided by DOE as we wrestle
6 with policy issues that require our decision,
7 including those that will inform U.S. leadership of
8 the Arctic Council over the next two years.

9 Our work is was often used as a basis
10:55:16 10 for informing decisions by federal regulators. One
11 example of this support that we provide is our
12 August, 2013, Memorandum of Collaboration between
13 DOE's Office of Fossil Energy and the Department of
14 Interior's Bureau of Safety and Environmental
10:55:34 15 Enforcement, better known to you as BSEE.

16 As many of you know, BSEE has regulatory
17 authority over drilling on offshore federal leases,
18 and it looks to us as their Office of Science.
19 Program work under this Memo has been directed
10:55:49 20 toward drilling in ultradeep waters in the Gulf of
21 Mexico.

22 While we know Arctic waters are
23 considerably shallower, this and similar work has

1 helped to inform offshore drilling practices in the
2 Arctic.

3 And, fourth, DOE has a strong
4 commitment, commitment to continuing collaboration
10:56:09 5 with the State of Alaska. And, that's not just
6 because Secretary Moniz likes to fly-fish there.

7 Yesterday Rex and I had the opportunity,
8 as you heard, to give a preview of the study to
9 Senator Murkowski, and we'll be discussing its
10:56:24 10 findings in the future with Governor Walker, as
11 well. DOE has had a long and productive working
12 relationship with Alaska institutions that can
13 support the planning and conduct of DOE
14 Arctic-related activity.

10:56:45 15 For example, our Office of Fossil Energy
16 and the State of Alaska have a Memo of
17 Understanding to conduct joint field research
18 assessing the potential for methane hydrates.
19 These types of collaborative engagements help us to
10:57:00 20 understand the nature of our Nation's remarkable
21 resources, and to prudently develop them.

22 So, in closing, I again want to thank
23 the NPC and all of its members for your cooperation

1 and investments in developing this impressive
2 report. Your sustained commitment to research and
3 prudent development of our natural resources has
4 helped make the United States the world's leader in
5 oil and natural-gas production.

6 And, this has created dynamic new
7 opportunities to grow our economy and position us
8 to continue to lead the world in the Twenty-First
9 Century. Your leadership and cooperation will
10 position us to lead in the Arctic, as well.

11 Thank you.

12 (Whereupon, applause was had.)

13 THE CHAIR: Thank you very much for your
14 remarks today, as well as we appreciate your
15 leadership in these important times. And, we look
16 forward to continuing to work with you as we go
17 forward.

18 I would say, just in follow-up, one
19 item, and that is: Since our December meeting, I
20 wanted to talk a little bit about emergency
21 preparedness, and talk about some of the plans for
22 implementing this.

23 I know that that I -- First of all I

1 want to thank the Secretary for his recent letter
2 that updated us on the Department of Energy's plans
3 for implementing the recommendations, and I would
4 just say that there has, since December, been some
10:59:04 5 actions in our industries, as well, in moving
6 forward with this report.

7 In particular, the Oil and Natural-Gas
8 Sector Coordinating Committee voted unanimously to
9 adopt the recommendation to expand the role during
10:59:22 10 supply chain disruptions. And, similarly, the
11 report will be reviewed at the upcoming Joint
12 Energy Government Coordinating Council meeting next
13 month.

14 Industry and Department of Energy
10:59:30 15 continue to progress the liaison contact list
16 recommendation as a part of the study. And, of
17 course, industry is updating the Oil and Natural
18 Gas Industry Emergency Preparedness Handbook.

19 You know, it was, it was pointed out
10:59:47 20 when this was approved by the Council that
21 emergency preparedness is, has got a different
22 focus, for instance, than the report that we just
23 approved today, and that is that it's something

1 that we need to take action on and, and continue to
2 implement, to practice, to test, because
3 emergencies can come at any time, and the only way
4 that we can best respond to it is if we have tested
5 our plans and have our plans in place.

6 So, again, again, a different focus, but
7 a very important effort. I just wanted to update
8 you on some of the things that we were doing for
9 enforcement. Yes?

10 Hon. DEPUTY SECRETARY STEWART-RANDALL:
11 Thank you. I just wanted to say thank you for this
12 work.

13 I'm, I'm practicing it closely, and I'm
14 responsible for all of our work that we're doing in
15 response at the Department. And, we're very
16 appreciative of the steps that have been taken.

17 And, we're working to develop, as you
18 know, an exercise series that will bring together
19 the oil-and-gas sector with the electricity sector
20 so that we can test and train ourselves for
21 response in advance of either a natural or a
22 manmade disaster. Thank you

23 THE CHAIR: Thank you very much. So, I,

1 I just, finally, I, I want to reiterate on behalf
2 of all the Council members our continuing
3 commitment to work with Department of Energy in
4 implementing the, the recommendations of that
5 report, as well as the communication of the report
6 that we just approved today.

11:01:50

7 At this point of the, the, the meeting
8 we're going to move into some administrative
9 matters, and I've got one announcement. First,
10 our, our web cast will conclude at this point.

11:02:05

11 So, for those who have been
12 participating on, on the Internet, we thank you for
13 watching these proceedings of this, and encourage
14 you to download and read the Arctic Research Report
15 that will be posted shortly.

11:02:19

16 So, we have the transmission ended now.

17 (Whereupon, the National Petroleum
18 Council moved into nonpublic session.)

19 I certify the foregoing to be a
20 true transcript from a video.
