Mrs. Maria Meyer  
SAM Laboratories  
Columbia University  
New York, N. Y.

Dear Maria:

By the time you get this letter I assume that you will be quite all right again and will not mind being bothered about two small things. One is that I just wrote a letter to Urey telling him all I can about the material on which he wanted information in connection with the PC work. I am afraid that this information is meager and unsatisfactory and I hope very much that it will not induce Urey to abandon the PC program. I was disappointed that it was not possible to get more helpful action at the present time. Could you let me know how the PC work is coming along.

The other point I wanted to write to you about is that before I left New York I met a very nice man by the name of Fuchs who is working with Peierls and in whom I think you would be interested. He was a student of Born and you remember that he has worked on Joe's theory of condensation. In the last few years he has been a collaborator of Peierls and he knows a lot about that part of the work. In talking, his spontaneous emission is very low but his induced emission is quite satisfactory. In case you did not meet him yet I thought you would like to know about him.

Wishing that you do not repeat anything of the kind that you recently did.

Yours,

Edward Teller
