CONTRACT NO: EP-S7-05-05

TASK ORDER NO: 0038

1.0 INTRODUCTION

HydroGeoLogic, Inc. (HGL) is conducting a comprehensive radiological characterization study of Area IV and the Northern Buffer Zone (NBZ) at the Santa Susana Field Laboratory (SSFL) site in Ventura County, California. This work is being executed under U.S. Environmental Protection Agency (USEPA) Region 7 Architect and Engineering Services Contract EP-S7-05-05, Task Order 0038. The technical lead on the project is USEPA Region 9.

As part of the radiological study, surface and subsurface soil samples were collected from locations identified from geophysical surveys, gamma scanning, historical aerial photographs and findings of the Historical Site Assessment. Sampling efforts in the study area were divided into Subareas. This Technical Memorandum documents the soil sampling activities, analytical results, and conclusions of the Subarea 5D round 1 soil sampling. The primary objective of the Subarea 5D soil sampling effort is to evaluate the nature of potential radionuclide contamination in soil that may have resulted from past nuclear operations. This objective was achieved through the collection and analysis of surface, subsurface, and drainage soil samples.

The approach for round 1 soil sampling was to identify potential sample locations from the lines of evidence listed above, prepare a Field Sampling Plan (FSP) Addendum for the subarea, present the FSP, and review and finalize proposed locations with USEPA's SSFL Technical Stakeholder Workgroup.

2.0 SOIL SAMPLING ACTIVITIES

2.1 Soil Sample Location Placement and Utility Clearance

A total of 482 surface, subsurface, and drainage samples were proposed in the Subarea 5D-North Addendum to the FSP for Soil Sampling (HGL, 2011a), and the Subarea 5D-South Addendum to the FSP for Soil Sampling (HGL, 2011b). Table 1 summarizes the proposed samples and lists the samples actually collected. Figure 1 illustrates soil sample locations (proposed and collected). Deviations from the FSP for Soil Sampling are discussed below.

The proposed sampling locations were discussed during technical review meetings held on April 20, 2011 (Subarea 5D-North) and August 17, 2011 (Subarea 5D-South), with members of USEPA's SSFL Technical Stakeholder Workgroup consisting of representatives of the Department of Energy (DOE), the State of California Department of Toxic Substances Control (DTSC), The Boeing Company (Boeing), USEPA, and the community.

After the locations were finalized with the Technical Stakeholder Workgroup, proposed sampling locations were marked in the field using a SPS 852 handheld Trimble global positioning system (GPS) and magnetic survey spikes. Before sampling activities commenced, utility clearances were performed at each location by Underground Service Alert (Dig Alert) and a private utility locator.

2.2 Sample Collection

Surface soil and drainage samples were collected using a stainless steel trowel or shovel. Subsurface samples were collected using a Geoprobe™ 6600 Series direct-push technology unit or a hand auger. Soil samples were collected in accordance with the procedures detailed in the Final FSP for Soil Sampling (HGL, 2012a), and the FSP Addendum for Subarea 5D (HGL, 2011a and 2011b). Soil cores were logged and the boring logs are provided in Attachment 2. A total of 465 surface, subsurface, and drainage soil samples were collected within Subarea 5D from May 16 through November 14, 2011.

During the April 20, 2011 (Subarea 5D-North) and August 17, 2011 (Subarea 5D-South), technical review meetings, recommendations and action items including those on the topic of Likely Decontamination and Decommissioning Zones (LD&DZ) and Likely Chemical Remediation Zones (LCRZ) were discussed. Building 4055 was designated as a LD&DZ, and the area north of former Building 4020 was designated as a LCRZ. USEPA understands that most, if not all, surface soil and infrastructure (building structures, concrete slabs, above-ground pipelines and underground pipelines etc.) may be excavated and removed from areas identified as LD&DZ and LCRZ. Therefore, USEPA placed a reduced number of surface and subsurface samples around the perimeter of these zones to better define the potential extent of contamination. In accordance with the USEPA's role under the Administrative Order on Consent (AOC) for Remedial Action (DTSC, 2010) agreement between DTSC and DOE for the SSFL site, USEPA will conduct confirmation soil sampling to verify that site remediation goals have been achieved at all such remediation zones. If the LD&DZ and LCRZs will not be excavated or removed, a data gap may exist. Additional investigations in the future may be

necessary to address the potential data gap. These follow-on efforts are not included in the current scope of work and will be accomplished using additional external funding.

2.3 Deviations from the Field Sampling Plan Addendum

Table 2 summarizes the deviations from the FSP and details why the planned sample was not collected. Subsurface soil samples were not collected from 21 locations because of insufficient sample volume due to shallow refusal. Additionally, four soil samples were added to the Subarea 5D sampling event. Surface and subsurface sample Location 207 was added based on a gamma detection of cesium, while Locations 39 and 40 each added an additional subsurface sample at the soil-bedrock interface to completely characterize the soil beneath the former underground storage tank at the Hot Lab (former Building 4020). These additional unplanned samples are included in the total number of samples collected and presented in Table 1.

2.4 Soil Boring Summary

A total of 245 subsurface borings were attempted, of which 122 borings were advanced to the proposed depth of 10 feet below ground surface (bgs), or deeper in select locations (HGL, 2011a). Total depths in soil borings that were completed to the proposed depth ranged from 10 to 24 feet bgs. A total of 123 borings could not be completed to the proposed depth because of shallow refusal. When shallow refusal was encountered two additional attempts were made, within a five foot radius, to reach the proposed depth. If after the third attempt the proposed depth could not be reached a sample was collected, where possible. Of the 123 borings, 61 borings could only be advanced to a depth less than 5.0 feet bgs and 62 could only be advanced to a depth greater than or equal to 5.0 but less than 10.0 feet bgs. Refusal was encountered in five of the borings due to rubble present in fill material and in 118 borings because bedrock was encountered before the proposed depth was reached.

Soil samples were classified and described in accordance with the Final FSP for Soil Sampling (HGL, 2012a). The most common soil types observed were sand, silty sand, silt, sandy clay, silty clay, and clay. A total of 124 locations encountered fill material in all or a portion of the boring. The fill material consisted of soils that exhibited a mottled texture and frequently contained anthropogenic material such as concrete, asphalt, or glass. Native soil was encountered below fill material in 115 of the 124 borings. A total of 123 borings consisted of only native soil. A summary of the boring log information is presented in Table A.1 and the boring logs are provided in Attachment 2.

3.0 ROUND 1 SOIL ANALYTICAL RESULTS

Analyses of soil samples were conducted in accordance with the draft revised Final Quality Assurance Project Plan (QAPP) for Soil Sampling which was finalized in March 2012 (HGL, 2012b). All soil samples were analyzed for the default suite of analytes presented in Table 2.3 of the FSP for Soil Sampling (HGL, 2012a). In addition to the default analytes, soil samples collected in the vicinity of several former buildings also were analyzed for the site-specific analytes as follows, in accordance with the rationale presented in Table 2.3 of the Final FSP for Soil Sampling (HGL, 2012a):

- former Building 4373: tritium (H-3), nickel (Ni)-59, Ni-63 and technetium (Tc)-99;
- former Building 4020: americium (Am)-243, carbon (C)-14, H-3, iodine (I)-129, Ni-59, Ni-63, promethium (Pm)-147 and Tc-99;
- former Parking Lot 4509 and former Building 4009: Am-243, C-14, H-3, Ni-59, Ni-63 and Tc-99.

3.1 Radiological Trigger Levels

Analytical results were compared to the radiological trigger levels (RTL) established specifically for the Area IV Santa Susana Field Laboratory Radiological Study. RTLs are reference soil concentrations for the radionuclides of concern for the Radiological Study. Analytical results below each RTL are considered uncontaminated or non-actionable, and results that exceed RTL are actionable and may represent contamination. The process used to derive the RTLs is presented in the Technical Memorandum, Radiological Trigger Levels (HGL, 2011c), and is briefly summarized below.

During the SSFL Radiological Background Study (HGL, 2011d), soil samples were collected from off-site locations representing the two geological formations present at the SSFL Site: the Chatsworth Formation and the Santa Susana Formation. Based on the results of the background samples Background Threshold Values (BTV) were developed, which are the upper concentration limits of radionuclides of concern from off-site locations. BTVs were calculated from 149 samples. For a single sample, in many instances the laboratory minimum detectable concentrations (MDCs) are greater than the respective BTV. Hence, the RTL for a particular radionuclide was established at the greater of BTV or MDC values plus an additional method uncertainty (for comparison of individual sample results to the RTL). Using this approach, it is assured that an RTL exceedance is greater than locally determined background concentrations.

3.2 Analytical Results

A total of 465 samples were collected during the Subarea 5D, round 1 soil sampling event. All of the soil samples collected were analyzed for the SSFL default suite as listed in Table 2.3 of the Final FSP for Soil Sampling (HGL, 2012a). In addition, select soil samples also were analyzed for Am-243, C-14, H-3, I-129, Ni-59, Ni-63, promethium (Pm)-147, and Tc-99.

Analytical results presented in the following subsections are described in three different ways:

1. The number of physical locations where a sample(s) was collected that contained at least one radionuclide that exceeded RTLs,
2. The number of samples containing radionuclides that exceeded the RTLs, and
3. The number of radionuclides that exceeded RTLs.

One location can have multiple samples containing multiple radionuclides that exceed RTLs. For example, a single physical location could have a surface sample that has three exceedances

and a subsurface sample that has four exceedances. Therefore, the results would be presented as: one location (two samples) containing seven radionuclides that exceeded RTLs.

Analytical results of soil samples collected during the round 1 sampling event reported a total of 22 site-related, man-made, radionuclide, RTL exceedances in 21 samples. Soil samples reported to contain radionuclide activities at or above the respective RTL were in the following areas:

- Hot Lab (former Building 4020)
- Building 4055
- Pond Dredge Area and Former Buildings 4375/4874/4875
- Former Building 4353 Area and Former Buildings 4173/4865 Ground Scar
- Subarea 5D-South

Table 3 summarizes the number of RTL exceedances detected during round 1 sampling by location, samples and radionuclides exceeding the RTLs.

Table 4 presents the sample location, sample type, radionuclide concentration, and technical justification for collecting additional soil samples. Figure 1 presents the locations of all the soil samples collected during round 1. Figures 2 through 6 present the location, radionuclide, and concentration detected above the RTLs in samples collected from the areas discussed above. A summary of the analytical results is provided in Table A.2.

Soil samples reported to contain radionuclide concentrations at or above the respective RTL were clustered in five primary areas within Subarea 5D as summarized below:

- **Hot Lab (former Building 4020)**
 - Cesium (Cs)-137 exceeded the RTL of 0.207 picocuries per gram (pCi/g) at one location (one sample) with a concentration of 1.42 pCi/g.

- Strontium (Sr)-90 exceeded the RTL of 0.485 pCi/g at eight locations (eight samples) with concentrations from 0.486 pCi/g to 1.55 pCi/g.
- Uranium (U)-235/236 exceeded the RTL of 0.151 pCi/g at one location (one sample) with a concentration of 0.234 pCi/g.
- One sample in this area also has multiple RTL exceedances (e.g., Cs-137 and Sr-90).
- **Building 4055 Area**
 - Strontium-90 exceeded the RTL of 0.485 pCi/g at two locations (two samples) with concentrations of 0.52 pCi/g and 0.662 pCi/g.
- **Pond Dredge Area and Former Buildings 4375/4874/4875**
 - Plutonium (Pu)-238 exceeded the RTL of 0.0415 pCi/g at one location (one sample) with a concentration of 0.0492 pCi/g.
 - Strontium-90 exceeded the RTL of 0.485 pCi/g at three locations (three samples) with concentrations of 0.487 pCi/g, 0.545 pCi/g, and 1.43 pCi/g.
- **Former Building 4353 Area and Former Buildings 4173/4865 Ground Scar**
 - Americium-241 exceeded the RTL of 0.0454 pCi/g at one location (one sample) with a concentration of 0.0589 pCi/g.
 - Plutonium-239/240 exceeded the RTL of 0.0404 pCi/g at one location (one sample) with a concentration of 0.0526 pCi/g.
 - Strontium-90 exceeded the RTL of 0.485 pCi/g at three locations (three samples) with concentrations of 0.619 pCi/g, 0.648 pCi/g, and 1.27 pCi/g.
- **Subarea 5D South**
 - Cesium-137 exceeded the RTL of 0.207 pCi/g at one location (one sample) with a concentration of 0.227 pCi/g.
 - Plutonium-239/240 exceeded the RTL of 0.0404 pCi/g at one location (one sample) with a concentration of 0.0502 pCi/g.

There were 29 locations (40 samples) where 18 naturally occurring radionuclides, also known as Naturally Occurring Radioactive Material (NORM), were detected above the RTLs. Nearly all of these NORM radionuclide exceedances originated from a particular area within the far south of Subarea 5D. The area is also with the Santa Susana geologic formation, which is distinct from most of Area IV and the NBZ. These exceedances were evaluated to determine whether they could reasonably be concluded to be site related. The determinations included assessment of the sample radioisotope ratios (comparisons between individual members of a specific decay chain), surface gamma scanning data, borehole gamma measurements, and local variations in geology.

Based on these evaluations, one location was determined to be potentially site related. The subsurface sample collected from round 1 Location 24 contained U-235/236 at 0.234 pCi/g, which exceeds the RTL of 0.151 pCi/g. Uranium-235, in particular, requires a greater level of scrutiny because it is enriched in nuclear fuel. Therefore, step-out sample locations 264, 265, and 266 were placed around this exceedance. The location, sample identification, radionuclide, activity, MDC, RTL, and sample depth are presented in Table 5.

For Locations 4 and 6, Cs-137 and Pu-239/240, respectively, exceeded their RTLs. These locations also had NORM exceedances. Because radionuclides were detected in conjunction with NORM radionuclides, both gamma spectrometry and U default analyses were requested for step-out samples of each location. Using this approach, the additional information can aid the interpretation of NORM results and provide further evidence to support the evaluation of NORM.

3.3 Subarea 5D Radiological Trigger Level Data Quality Gap Result Evaluations

The use of RTLs is predicated on the assumption that analytical results will be of known and predictable quality, with the uncertainty constrained to a level that supports direct comparison of results to RTLs. The use of RTLs is predicated on the assumption that analytical results will be of known and predictable quality, with the uncertainty constrained to a level that supports direct comparison of results to RTLs. As stated in the QAPP, the pertinent data quality objective (DQO) considered in the development of RTLs is that radioactivity exceedance decision error rates will be less than 5 percent. This DQO is achieved by the primary measurement quality objective (MQO) that samples with reported activity greater than the RTL should have a combined standard uncertainty of less than 10 percent.

In some cases, matrix or spectral interference, or the laboratory's occasional use of non-optimal instrumentation, results in analytical uncertainties greater than the desired 10 percent for a small percentage of analytical results. In these cases, a decision must be made whether the uncertainty is sufficiently constrained to be used to make radioactivity exceedance decisions.

The MDC is the level of activity in a sample that may be statistically distinguished from a blank sample at the 95 percent confidence interval. In practice, the MDC is a level of activity at which the uncertainty is constrained to a predictable fraction of the reported activity. It is determined, by review of the reported data and from technical judgment, that results above the reported MDC will have the associated uncertainty constrained to degree that may be useful for decision-making in exceptional circumstances, with professional oversight. Results below the associated MDC may not be usable for decision-making and represent potential data quality gaps.

A data quality gap is a sample result for which the MDC is greater than the RTL, but the reported activity is below the RTL, indicating an indeterminate result that may or may not exceed the RTL. The elevated MDC indicates a result that lacks sufficient precision to support decision making at the RTLs.

It is understood that, for all results, the reported analytical uncertainty is sufficiently reliable to be considered, however the magnitude of that uncertainty may not always allow direct comparison of the activity to the RTL, as discussed above. In many cases, the reported activity is sufficiently below the RTL (more than the associated, elevated 2σ total propagated uncertainty [TPU]) to decide that the result does not represent an exceedance. For these cases, results are removed from further data quality gap assessment.

Remaining data quality gap results are evaluated on a case-by-case basis to determine whether further action is warranted or beneficial. Out of 490 samples, with 21,470 total results, there are 108 such data quality gaps in Subarea 5D.

- Of the 108 data quality gaps requiring further assessment, four data quality gap samples have RTL exceedances for other analytes. Further clarification of these data quality gaps is not believed to be necessary, as step-out sampling is already scheduled at those locations. The step-out sample analyses will include the data quality gap analytes, as well as the confirmed exceedances.
- Of the remaining 104 data quality gaps, 89 are associated with lower energy gamma spectrometry results, which are subject to sample-specific spectral interference from an elevated Compton continuum. This is an inherent limitation of gamma spectrometry and further analysis is not expected to significantly improve these results. The data quality gaps do not support a determination of an exceedance and no further action is planned. An additional four results demonstrate the same gamma spectral quality issue, but they are associated with the previously determined exceedances described above, and step-out sampling is already planned for those sample locations.
- Sample 50488 has a data quality gap for curium (Cm)-243/244, apparently resulting from a low chemical yield of 37.5 percent. It is reasonable that the laboratory might improve the quality of the reported data to eliminate the data quality gap by preparing the sample for reanalysis. The laboratory has been requested to prepare a new aliquant for analysis and to meet the project DQOs, in addition to achieving an MDC of less than 0.044 pCi/g for Cm-243/244 (the analyte RTL), if possible.
- Sample 50124 has a data quality gap for Cm-243/244, apparently resulting from a low chemical yield of 42.5 percent. It is reasonable that the laboratory might improve the quality of the reported data to eliminate the data quality gap by preparing the sample for reanalysis. The laboratory has been requested to prepare a new aliquant for analysis and to meet the project DQOs, in addition to achieving an MDC of less than 0.044 pCi/g for Cm-243/244 (the analyte RTL), if possible.
- Sample 50363 has a data quality gap for Pu-238, resulting from the use of a detector with a slightly elevated background count rate in the spectral region of interest. It is reasonable to expect that the laboratory may improve the quality of the reported data to eliminate the data quality gap. The laboratory has been requested to either recount the existing sample or prepare a new aliquant for analysis and to meet the project DQOs, in addition to achieving an MDC of less than 0.041 pCi/g (the analyte RTL), if possible.
- Sample 50326 has a data quality gap for Pu-239/240, resulting from the use of a detector with a slightly elevated background count rate in the spectral region of interest. It is reasonable to expect that the laboratory may improve the quality of the reported data to eliminate the data quality gap. The laboratory has been requested to either recount the existing sample or prepare a new aliquant for analysis and to meet the project DQOs, in addition to achieving an MDC of less than 0.040 pCi/g (the analyte RTL), if possible.

- Samples 50076, 50325, and 50407 have data quality gaps for Pu-238, apparently resulting from lower chemical yields than typically observed, as well as elevated instrument background count rates. It is reasonable that the laboratory might improve the quality of the reported data to eliminate the data quality gaps by preparing the sample for reanalysis. The laboratory has been requested to prepare new aliquants for analysis and to meet the project DQOs, in addition to achieving an MDC of less than 0.041 (the analyte RTL), if possible.
- Sample 50130 has a data quality gap for U-235/236 resulting from low chemical yield. The sample initially demonstrated low chemical yield, was re-prepared and had to undergo additional treatment to remove observed matrix interference effects, and was ultimately analyzed with a chemical yield of 22.8%. A third attempt at the isotopic uranium method is not expected to result in significantly improved data quality and no further action is recommended.
- Sample 50090 has a data quality gap for thorium (Th)-229, apparently resulting from the use of a detector with an elevated background count rate. It is reasonable to expect that the laboratory may improve the quality of the reported data to eliminate the data quality gap. The laboratory has been requested to either recount the existing sample or prepare a new aliquant for analysis and to meet the project DQOs, in addition to achieving an MDC of less than 0.145 pCi/g (the analyte RTL), if possible.
- Sample 50475 has a data quality gap for Sr-90. The root cause is undetermined and is believed to be associated with routine statistical fluctuations in the sample and/or background count rate, as well as a lower than typical chemical yield. It is reasonable that the laboratory may improve the quality of the reported data to eliminate the data quality gap. The laboratory has been requested to either recount the existing sample or prepare a new aliquant for analysis and to meet the project DQOs, in addition to achieving an MDC of less than 0.485 pCi/g (the analyte RTL), if possible.
- Samples 50144, 50164, 50195, and 50222 have data quality gaps for cobalt (Co)-60. In addition, sample 50164 also has a data quality gap for sodium (Na)-22. These samples were all counted on the same gamma spectrometry detector that appears to have a lower counting efficiency at higher gamma emission energies than other detectors employed in the laboratory. It is reasonable that the laboratory may improve the quality of the reported data to eliminate the data quality gap by recounting the samples on a different, higher efficiency detector and/or for a longer count period. The laboratory has been requested to recount the existing sample and to meet the project DQOs, in addition to achieving an MDC of less than 0.028 pCi/g for Co-60 and 0.037 pCi/g for Na-22 (the analyte RTLs), if possible.

In summary, the samples listed in Table 6 will be either recounted or prepared for reanalysis in order to achieve an MDC that is no higher than the project RTLs. The results of the recounts or reanalysis will be presented in the Technical Memorandum, Subarea 5D, Round 2 Soil Sample Results.

4.0 QUALITY ASSURANCE/QUALITY CONTROL SAMPLES

In addition to the environmental samples collected, quality control samples were collected as described in the QAPP (HGL, 2012b). The results of the quality control samples collected and their affect on data usability are described in the following subsections.

4.1 Field Duplicates

Field duplicate soil samples were collected at a frequency of 1 per 20 samples (5 percent). A total of 25 field duplicate samples were collected during the round 1 sampling event. The field duplicate evaluation criterion includes an additional 1σ uncertainty factor of 10 percent to allow for heterogeneity of co-located, but non-homogenized, field samples.

The comparability of a field duplicate result to that of the original sample is assessed by evaluating the Z-score (Z_{DUP}). The Z-score is a statistical test that indicates how many standard deviations an observation is from the expected value. The Z-score is defined in the QAPP (HGL, 2012b), and the Z_{DUP} is calculated as follows:

$$Z_{DUP} = \frac{|X_s - X_d|}{\sqrt{u_s^2 + u_d^2}}$$

where:

- X_s = activity of the sample
- X_d = activity of the duplicate
- u_s = combined standard (1σ) uncertainty of the sample
- u_d = combined standard (1σ) uncertainty of the duplicate

Higher Z_{DUP} scores indicate greater disparity between the sample and the duplicate results. A Z_{DUP} score of 2.0, for example, indicates that the duplicate result differs from the sample result by twice the overall uncertainty of the two results. By extension, a Z_{DUP} score of 1.96 (the warning level) indicates that the two results are statistically equivalent, at the 95 percent confidence interval. A Z_{DUP} score of 2.58 (the exceedance level) indicates that the two results are statistically equivalent, at the 99 percent confidence interval.

A Z_{DUP} evaluation is performed on each paired set of analytes for which parent and duplicate data are reported. This quality assurance/quality control assessment is performed on the validated laboratory results approved and accepted by the project, and recorded in the project database as of May 7, 2012. Subsequent modifications to the approved data or the project database may not be reflected in this assessment.

Round 1 field duplicate sample data includes 2,189 results from 1,094 sample/duplicate pairs and a single unpaired result for which the duplicate result was unreported. Those original reported results included analytes which were not evaluated for any of the following reasons: several radionuclides were removed from consideration (and do not have RTLs), results

rejected by data validation, and analytes that are simply inferred from previously reported results, such as yttrium-90, which is inferred from the reported Sr-90 results, are redundant.

The Z_{DUP} evaluation of the remaining 969 qualified pairs follows:

- 928 results (95.8 percent) were within the expected 95 percent confidence interval for this evaluation, with Z_{DUP} less than 1.96;
- 28 results (2.9 percent) were between the 95 percent and 99 percent confidence interval with Z_{DUP} at or above 1.96, but below 2.58;
- 13 results (1.3 percent) exceeded the 99 percent confidence interval, with Z_{DUP} values at or above 2.58.

The Z_{DUP} statistical test predicts that, in a homogeneous sample/duplicate pairing, 4 percent of reported Z_{DUP} scores (approximately 39 results in this Z_{DUP} set) will be in the warning range between 1.96 and 2.58. In addition, 1 percent (approximately 10 results in this Z_{DUP} set) are expected to exceed a Z_{DUP} score of 2.58.

A review of the Z_{DUP} warnings and exceedances, and the associated laboratory data, has been conducted and the following observations are made regarding the collection and analysis of field duplicate samples:

- The highest exceedance, i.e. Z_{DUP} score at or above 2.58, is related to the sample/duplicate pair 50399/50411, in which the lead (Pb)-214 and bismuth (Bi)-214 Z_{DUP} scores are 5.15 and 4.97, respectively. The two analytes are in the same decay chain, are measured independently, and confirm the relative high bias of the parent sample over the field duplicate sample. The results suggest a small degree of heterogeneity in the field that has not otherwise been accounted for in the assessment.
- The remaining Z_{DUP} exceedances involve Z_{DUP} scores at or below 3.58. While this may also indicate a degree of heterogeneity in the field that has not otherwise been accounted for in the assessment, or an underestimate in the laboratory's reported uncertainty beyond that discussed above, a review of the frequency and magnitude of the Z_{DUP} excursions, as well as a review of the individual results and associated laboratory data, do not indicate significant concerns regarding the quality or usability of the data.
- The 28 Z_{DUP} scores in the warning range, between 1.96 and 2.58, are within the expected frequency and do not appear to represent a data quality excursion.

A summary of the parent and associated duplicate sample results is provided Table A.3.

4.2 Equipment Rinsate and Source Water Blanks

Equipment rinsate blanks were collected at a frequency of one per day, for each type of sampling equipment used per field team. Equipment rinsate blanks were collected in accordance with the FSP for Soil Sampling (HGL, 2012a) and the QAPP (HGL, 2012b). A

total of 74 rinsate and three source water samples were collected during the round 1 sampling event. Each sample was tested for isotopic uranium, as a surrogate indicator of cross-contamination. Any results that were rejected for laboratory quality reasons would have been removed from consideration, as in the evaluation of field duplicate samples. In this dataset, however, no sample results were rejected. Rinsate and source water samples were also analyzed for H-3 if it was included in the analytical suite for samples collected that day.

In all cases, the samples were analyzed by the laboratory as received and the Total activity is reported.

Round 1 rinsate and source water samples include 477 total results, from which 237 data pairs were evaluated by Z-score duplicate comparison. The Z_{DUP} scores are summarized below.

- 236 results (99.6 percent) were within the expected 95 percent confidence interval for this evaluation, with Z_{DUP} less than 1.96;
- One result (0.4 percent) was between the 95 percent and 99 percent confidence interval with Z_{DUP} at or above 1.96, but below 2.58;
- Zero results (0.0 percent) exceeded the 99 percent confidence interval, with Z_{DUP} values at or above 2.58.

As with the field duplicates, the Z_{DUP} statistical test predicts that approximately 4 percent of reported Z_{DUP} scores will be in the range between 1.96 and 2.58. The one result in that warning range is well below the expected frequency.

The evaluation of equipment blank results indicates that the decontamination of the field sampling equipment is acceptable and that there is no evidence of sample cross-contamination from the sampling equipment that would adversely affect the quality or usability of the reported field sample data. A summary of the rinsate and source water blank analytical results are provided in Table A.4.

5.0 SUMMARY OF FINDINGS

Radionuclide concentrations exceeding RTLs were detected in samples collected from five primary areas:

- Hot Lab (former Building 4020)
- Building 4055
- Pond Dredge Area and former Buildings 4375/4874/4875
- Former Building 4353 Area and former Buildings 4173/4865 Ground Scar
- Subarea 5D-South

The radionuclides that were detected at concentrations exceeding the RTLs in these areas are summarized below:

- Americium-241 was detected at one location (one sample) at a concentration of 0.0589 pCi/g.
- Cesium-137 was detected at two locations (two samples) at concentrations of 0.227 pCi/g and 1.42 pCi/g.
- Plutonium-238 was detected at one location (one sample) at a concentration of 0.0492 pCi/g.
- Plutonium-239/240 was detected at two locations (two samples) at concentrations of 0.0502 pCi/g and 0.0526 pCi/g.
- Strontium-90 was detected at 16 locations (16 samples) with concentrations from 0.486 pCi/g to 1.55 pCi/g.
- Uranium-235/236 was detected at one location (one sample) at a concentration of 0.234 pCi/g.

Round 2 soil sampling activities will consist of collecting additional step-out soil samples in the vicinity of each exceedance identified in round 1 samples. The Draft Subarea 5D Round 2 FSP Addendum (HGL, 2012c) describes the proposed step-out soil sampling locations, analytical testing, and technical justification for the additional sample locations.

Refer to Table 2.1 of the Final Field Sampling Plan for Soil Sampling (HGL, 2012a) for a definition of radionuclide symbols.

No historical radiological data is available for these locations.

Reporting units in picocuries per gram.

bgs - below ground surface

ft - feet

GRAY - gamma radiation anomaly

HSA - Historical Site Assessment

ID - identification

J - The analyte was detected at the reported concentration; the quantitation is an estimate.

MDC - minimum detection concentration

PGRAY - potential gamma radiation anomaly

RAD - radiological

Notes:

Refer to Table 2.1 of the Final Field Sampling Plan for Soil Sampling (HGL, 2012a) for a definition of radionuclide symbols.

Reporting units in picocuries per gram.

bgs - below ground surface

MDC - minimum detectable concentration

ID - Identification

RTL - radiological trigger level

TPU - total propagated uncertainty

J - The analyte was detected at the reported concentration; the quantitation is an estimate.

K - Analyte present. Reported value may be biased high. Actual value is expected to be lower.

S - Analyte result is subject to spectral interference. Unless otherwise qualified, the data is believed to be consistent with the background study results and may be used for its intended purpose.

L - Analyte present. Reported value may be biased low. Actual value is expected to be higher.

R - The result is rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria.

U - Not considered detected. The associated number is the reported concentration.

UJ - Not considered detected. The associated number is the reported concentration, which may be inaccurate.

UL - Not considered detected. The associated number is the reported concentration, which may be inaccurate due to a low bias.

Notes:

Refer to Table 2.1 of the Field Sampling Plan for Soil Sampling (HGL,2012a) for a definition of radionuclide symbols.

Reporting units in picocuries per gram.

ID - Identification

MDC - minimum detectable concentration

TPU - total propagated uncertainty

J - The analyte was detected at the reported concentration; the quantitation is an estimate.

S - Analyte result is subject to spectral interference. Unless otherwise qualified, the data is believed to be consistent with the background study results and may be used for its intended purpose.

L - Analyte present. Reported value may be biased low. Actual value is expected to be higher.

U - Not considered detected. The associated number is the reported concentration.

U J - Not considered detected. The associated number is the reported concentration, which may be inaccurate.

UL - Not considered detected. The associated number is the reported concentration, which may be inaccurate due to a low bias.

Notes:

¹H-3 analyses was only required if it was included in the analytical suite for samples collected that day.

Refer to Table 2.1 of the Final Field Sampling Plan for Soil Sampling (HGL, 2012a) for a definition of radionuclide symbols.

Reporting units in picocuries per liter.

-- - not analyzed for

ID - Identification

MDC - minimum detectable concentration

TPU - total propagated uncertainty

J - The analyte was detected at the reported concentration; the quantitation is an estimate.

U - Not considered detected. The associated number is the reported concentration.
