SUBJECT: Subarea 6, Round 2 Soil Sample Results

CONTRACT NO: EP-S7-05-05

TASK ORDER NO: 0038

1.0 INTRODUCTION

HydroGeoLogic, Inc. (HGL) is conducting a comprehensive radiological characterization study of Area IV and the Northern Buffer Zone (NBZ) at the Santa Susana Field Laboratory (SSFL) site in Ventura County, California. This work is being executed under U.S. Environmental Protection Agency (USEPA) Region 7 Architect and Engineering Services Contract EP-S7-05-05, Task Order 0038. The technical lead on the project is USEPA Region 9.

As part of the radiological study, surface and subsurface soil samples were collected from locations identified from geophysical surveys, gamma scanning, historical aerial photographs and findings of the Historical Site Assessment. Sampling efforts in the study area were divided into subareas. Analytical results from the Round 1 sampling activities were reviewed in conjunction with the aforementioned lines of evidence, and sample locations were targeted for further investigation in the Round 2 soil sampling effort. This technical memorandum documents the soil sampling activities, analytical results, and conclusions of the Subarea 5C Round 2 soil sampling. The primary objective of the soil sampling effort was to further investigate potential radionuclide contamination by laterally and vertically delineating radionuclide concentrations that exceeded project established Radiological Trigger Levels (RTL) detected during the Round 1 sampling activities. This objective was achieved through the collection and analysis of step-out surface and subsurface soil sample locations, as described in Section 4.2 of the Final FSP for Soil Sampling (HGL, 2012a). If an exceedance was isolated, a step-out location was placed approximately 15 feet north, south, east, and west of the Round 1 exceedance locations. If there were multiple Round 1 exceedances in a specific area, step-out sampling locations were targeted around the exceedances to best characterize the lateral and vertical extent of potential radionuclide-affected soils.

The approach for Round 2 soil sampling was to identify potential sample locations from the lines of evidence listed above, prepare a Round 2 Field Sampling Plan (FSP) Addendum for the subarea, present the FSP, and review and finalize proposed locations with USEPA's SSFL Technical Stakeholder Workgroup.

2.0 SOIL SAMPLING ACTIVITIES

2.1 Soil Sample Location Placement and Utility Clearance

A total of three drainage soil, 97 surface soil, and 107 subsurface soil samples were proposed in the Subarea 6 Round 2 Addendum to the Final FSP for Soil Sampling (HGL, 2012b). During Round 2 soil sampling activities, six surface and six subsurface soil samples were attempted to be collected from six additional locations. The rationale for the original soil step-out sample locations is detailed in the Subarea 6 Round 2 Addendum to the Final FSP for Soil Sampling (HGL, 2012b). The rationale for the additional six sampling locations (12 soil samples) added after the Round 2 FSP addendum was finalized is presented in Section 2.3 of this document.

The proposed sampling locations were discussed during the technical review meeting held on February 22, 2012, with members of USEPA's SSFL Technical Stakeholder Workgroup consisting of representatives of the Department of Energy (DOE), the State of California Department of Toxic Substances Control (DTSC), The Boeing Company (Boeing), USEPA, and the community.

After the locations were finalized with the Stakeholder Workgroup, proposed sampling locations were marked in the field using a SPS 852 handheld Trimble global positioning system (GPS) and magnetic survey spikes. Before sampling activities commenced, utility clearances were performed at each location by Underground Service Alert (Dig Alert) and a private utility locator.

Table 1 summarizes the proposed samples and lists the samples collected. Figure 1 illustrates all the soil sample locations (proposed and collected). Deviations from the FSP are discussed in Section 2.3.

2.2 Sample Collection

Surface soil samples were collected using a stainless steel trowel or shovel. Subsurface samples were collected using a Geoprobe 6600 Series direct-push technology unit or a hand auger. Soil samples were collected in accordance with the procedures detailed in the Final FSP for Soil Sampling (HGL, 2012a), and the Round 2 FSP Addendum for Subarea 6 (HGL, 2012b). Soil cores were logged and the boring logs are provided in Attachment 2. A total of 205 soil samples (three drainage, 103 surface, and 99 subsurface) were collected within Subarea 6 from March 20, 2012, to April 20, 2012.

During the February 22, 2012, technical review meeting recommendations and action items including those on the topic of Likely Chemical Remediation Zones (LCRZ) and Likely

Decontamination and Decommissioning Zone (LD&DZ) were discussed. USEPA understands that most, if not all, surface soil and infrastructure (building structures, concrete slabs, above-ground pipelines and underground pipelines etc.) may be excavated and removed from areas identified as LD&DZ and LCRZ. In accordance with the USEPA's role under the Administrative Order on Consent (AOC) for Remedial Action (DTSC, 2010) agreement between DTSC and DOE for the SSFL site, USEPA will conduct confirmation soil sampling to verify that site remediation goals have been achieved at all such remediation zones. These follow-on efforts are not included in the current scope of work and will be accomplished using additional external funding.

2.3 Deviations from the Field Sampling Plan Addendum

A total of 207 soil samples (three drainage, 97 surface, and 107 subsurface) were originally proposed in the Subarea 6 Round 2 Addendum to the Final FSP for Soil Sampling (HGL, 2012b). An additional 12 soil samples (six surface and six subsurface) were proposed after the Round 2 FSP addendum had been finalized; therefore, the number of planned samples was revised to a total of 291 soil samples (three drainage, 103 surface, and 113 subsurface).

A total of 14 subsurface samples could not be collected due to insufficient soil volume as a result of shallow refusal on bedrock. A total of 205 soil samples (three drainage, 103 surface and 99 subsurface) were actually collected during the Subarea 6 Round 2 sampling event.

The additional 12 soil samples (six surface and six subsurface) were added to the Round 2 sampling event to further characterize Round 1 potential gamma radiation anomalies (PGRAY) that, after further evaluation, were determined to be gamma radiation anomalies (GRAY), and to verify Round 1 europium (Eu)-152 results.

Location 6-00426 was added to characterize GRAY 6-7, Location 6-00427 was added to characterize GRAY 6-14, and Location 6-00428 was added to characterize GRAY 6-53. Locations 6-00346, 6-00347, and 6-00357 were added to verify a Eu-152 result detected during the Round 1 soil sampling event. The concentration reported by the laboratory was determined to be a laboratory quality control (QC) (matrix spike) result and not actually present in the soil. Table 2 summarizes the locations and sample identifications of the samples that could not be collected.

2.4 Soil Boring Summary

A total of 113 subsurface borings were attempted, of which 19 borings were advanced to 10 feet below ground surface (bgs), 31 were terminated between 5 to 10 feet bgs, and 63 were completed at a depth less than 5 feet bgs. Of the 94 boreholes that were terminated at a depth less than 10 feet bgs, four were due to refusal on construction rubble and 90 were due to refusal at bedrock.

Soil samples were classified and described in accordance with the Final FSP for Soil Sampling (HGL, 2012a). The most common soil types observed were sand, silty sand, silt, and clay. A total of 35 locations encountered fill material in all or a portion of the boring. Thirty one

locations encountered soil fill material consisting of soils that exhibited a mottled texture and frequently contained pea size gravel. Four locations encountered construction rubble fill material consisting of burnt wood, asphalt, and concrete. Native soil was encountered below fill material in 24 of the 35 borings. A total of 78 borings consisted of only native soil. A summary of the boring log information is presented in Table A.1 and the boring logs are provided in Attachment 2.

3.0 SOIL ANALYTICAL RESULTS

Analyses of soil samples were conducted in accordance with the Final Quality Assurance Project Plan (QAPP) for Soil Sampling (HGL, 2012c). All samples were collected in accordance with the rationale presented in Table 2.3 of the Final FSP for Soil Sampling (HGL, 2012a). Round 2 sample locations and analytical suites are presented in the Subarea 6 Round 2 Addendum to the Final FSP for Soil Sampling (HGL, 2012b). Deviations from the Round 2 FSP addendum are presented in Section 2.3.

3.1 Round 1 Data Quality Gap Reanalysis

A data quality gap is a sample result for which the minimum detectable concentrations (MDC) is greater than the RTL, but the reported activity is below the RTL, indicating an indeterminate result that may or may not exceed the RTL. The elevated MDC could be the result of sample matrix or spectral interference or, in some cases, laboratory issues that prevent accurate quantification of sample activity to a level low enough to support the RTLs.

The use of RTLs is predicated on the assumption that analytical results will be of known and predictable quality, with the uncertainty constrained to a level that supports direct comparison of results to RTLs. The reported analytical uncertainty is sufficiently reliable to be considered, however the magnitude of that uncertainty may not always allow direct comparison of the activity to the RTL, as discussed above. In many cases, the reported activity is sufficiently below the RTL (more than the associated, elevated 2σ total propagated uncertainty) to decide that the result does not represent an exceedance. For these cases, results are removed from further data quality gap assessment.

During the Round 1 sampling event, there were seven samples (seven values) identified as data quality gaps, in which the laboratory was directed to reanalyze the sample to achieve lower MDC value. The Round 1 data quality gaps are summarized as follows:

- Sample 60046 was identified as a data quality gap for cobalt (Co)-60 resulting from a low sample density and small sample aliquant for analysis.
- Sample 60107 was identified as a data quality gap for technetium (Tc)-99, resulting from the sample being analyzed on a different detector than all other samples in that batch and only being counted for 30 minutes, instead of the 50-minute count duration used for all other samples in the batch.

- Samples 60334 and 60412 were identified as a data quality gap for thorium (Th)-229, because of the laboratory's use of alpha spectrometry detector with relatively high background count rates for the Th-229 region of interest.
- Sample 60490 was identified as a data quality gap for plutonium (Pu)-238 because of the laboratory's use of an alpha spectrometry detector with a relatively high background count rate for the Pu-238 region of interest.
- Sample 60065 was identified as a data quality gap for americium (Am)-241 because of the MDC being a larger value than the RTL.
- Sample 60458 was identified as a data quality gap for Pu-238 because of the MDC being a larger value than the RTL.

The MDC values for all Round 1 reanalyzed samples were lower than the RTLs; therefore, these samples are no longer considered data quality gaps. Also, no additional Round 1 exceedances were identified from the reanalyzed data. The Round 1 data quality gaps are presented in the Final Technical Memorandum, Subarea 6 Round 1 Soil Sample Results (HGL, 2012d). Table 3 summarizes the Round 1 reanalyzed activity, reanalyzed MDC values, and RTLs.

Table 3
Summary of Reanalyzed Round 1 Data Quality Gap Samples

Location ID	Sample ID	Analyte Name	Reanalyzed Activity	Reanalyzed MDC	RTL
6-00034	60046	Co-60	-0.0054	0.0213	0.028
6-00045	60065	Am-241	0.0044	0.0254	0.045
6-00067	60107	Tc-99	-0.195	1.18	1.63
6-00217	60334	Th-229	0.0152	0.0988	0.145
6-00268	60412	Th-229	-0.0056	0.0882	0.145
6-00312	60490	Pu-238	0.0143	0.0352	0.0415
6-00296	60458	Pu-238	-0.0045	0.0223	0.0415

ID - identification

3.2 Round 2 Analytical Results

Round 2 soil sampling locations were determined based on RTL exceedances detected in Round 1 soil samples. The Round 2 samples were tested for those analytes that were detected above the RTL in Round 1 samples.

Radiological trigger levels are reference soil concentrations for the radionuclides of concern for the SSFL Area IV Radiological Study. They were designed for screening analytical results of site soil and sediment collected during Round 1 sampling to inform decisions for Round 2 sampling (also called step-out sampling). Individual Round 1 analytical results were compared to RTLs and if results exceed an RTL step-out sampling was conducted. The primary purpose

of the RTLs were to guide the placement of Round 2 sampling locations and will not be used to screen Round 2 sample results.

The Round 2 analytical results are documented in this technical memorandum; however, the analytical results have not been screened using the RTLs. The Subarea 6 Round 2 analytical results will be evaluated, along with Round 1 results, using Field Action Level (FAL) established specifically for the SSFL Area IV Radiological Study. The results of the evaluation will be presented in the Radiological Characterization of Soils in Area IV and NBZ report.

Figure 1 presents the locations of the soil samples collected during the Round 1 and Round 2 sampling events. A summary of the Round 2 analytical results is provided in Table A.2.

4.0 QUALITY ASSURANCE/QUALITY CONTROL SAMPLES

In addition to the environmental samples collected, quality control samples were collected as described in the QAPP (HGL, 2012c). The results of the quality control samples collected and their affect on data usability are described in the following subsections.

4.1 Field Duplicates

Field duplicate soil samples were collected at a frequency of 1 per 20 samples (5 percent). A total of ten field duplicate samples were collected during the Round 2 sampling event. The field duplicate evaluation criterion includes an additional 1σ uncertainty factor of 10 percent to allow for heterogeneity of co-located, but non-homogenized, field samples.

The comparability of a field duplicate result to that of the original sample is assessed by evaluating the Z-score (Z_{DUP}). The Z-score is a statistical test that indicates how many standard deviations an observation is from the expected value. The Z-score is defined in the QAPP (HGL, 2012c), and the Z_{DUP} is calculated as follows:

$$Z_{DUP} = \frac{|X_s - X_d|}{\sqrt{u_s^2 + u_d^2}}$$

where:

- | | | |
|-------|---|--|
| X_s | = | activity of the sample |
| X_d | = | activity of the duplicate |
| u_s | = | combined standard (1σ) uncertainty of the sample |
| u_d | = | combined standard (1σ) uncertainty of the duplicate |

Higher Z_{DUP} scores indicate greater disparity between the sample and the duplicate results. A Z_{DUP} score of 2.0, for example, indicates that the duplicate result differs from the sample result by twice the overall uncertainty of the two results. By extension, a Z_{DUP} score of 1.96 (the warning level) indicates that the two results are statistically equivalent, at the 95 percent confidence interval. A Z_{DUP} score of 2.58 (the exceedance level) indicates that the two results are statistically equivalent, at the 99 percent confidence interval.

A Z_{DUP} evaluation is performed on each paired set of analytes for which parent and duplicate data are reported. This quality assurance/quality control assessment is performed on the validated laboratory results approved and accepted by the project, and recorded in the project database as of September 19, 2012. Subsequent modifications to the approved data or the project database may not be reflected in this assessment.

Round 2 field duplicate sample data includes 586 individual radionuclide results from 293 sample/duplicate paired results. Those results included several analytes that were subsequently removed from consideration and, thus, were not evaluated. In addition, any individual radionuclide results that were rejected by data validation were removed from consideration. Finally, analytes that are simply inferred from previously reported results, such as yttrium-90 which is inferred from the reported strontium (Sr)-90 results, are considered redundant and have also been removed from consideration.

The Z_{DUP} evaluation of the remaining 247 qualified data pairs follows:

- 241 Z_{DUP} evaluation results (97.6 percent) were within the expected 95 percent confidence interval for this evaluation, with Z_{DUP} less than 1.96;
- Five Z_{DUP} evaluation results (2.0 percent) were between the 95 percent and 99 percent confidence interval for this evaluation, with Z_{DUP} at or above 1.96, but below 2.58; and
- One Z_{DUP} evaluation result (0.4 percent) exceeded the 99 percent confidence interval for this evaluation, with a Z_{DUP} value at or above 2.58.

The Z_{DUP} statistical test predicts that, in a homogeneous sample/duplicate pairing, 4 percent of reported Z_{DUP} scores (approximately 10 Z_{DUP} results in this Z_{DUP} set) will be in the “warning” range between 1.96 and 2.58. In addition, 1 percent (approximately two Z_{DUP} evaluation results in this Z_{DUP} set) are expected to exceed a Z_{DUP} score of 2.58.

A review of the Z_{DUP} “warnings” and “exceedances,” and the associated laboratory data, has been conducted and the frequency and magnitude of the Z_{DUP} scores in this data set are at or below the expected range and does not appear to indicate a data quality excursion. A summary of the parent and associated duplicate sample results is provided Table A.3.

4.2 Equipment Rinsate and Source Water Blanks

Equipment rinsate blanks were collected at a frequency of one per day for each type of sampling equipment used per field team. Equipment rinsate blanks were collected in accordance with the Final FSP for Soil Sampling (HGL, 2012a) and the Final QAPP (HGL, 2012c). A total of 53 rinsate samples and two source water samples were collected during the Round 2 sampling event. Each sample was tested for isotopic uranium (U), as a surrogate indicator of cross contamination. Any results that were rejected for laboratory quality reasons would have been removed from consideration, as in the evaluation of field duplicate samples. In this dataset, however, no sample results were rejected. Rinsate and source water samples

were also analyzed for tritium if it was included in the analytical suite for samples collected that day.

This equipment rinsate assessment was performed on the validated laboratory results, approved and accepted by the project data manager, and recorded in the project database as of September 19, 2012. Subsequent modifications to the approved data or the project database may not be reflected in this assessment.

In all cases, the samples were analyzed by the laboratory as received and the Total activity is reported.

Round 2 rinsate and source water samples include 322 Total activity results, from which 161 data pairs were evaluated by Z-score duplicate comparison. The Z_{DUP} scores are summarized below:

- 155 Z_{DUP} evaluation results (96.3 percent) were within the expected 95 percent confidence interval for this evaluation, with Z_{DUP} less than 1.96;
- Five Z_{DUP} evaluation results (3.1 percent) were between the 95 percent and 99 percent confidence interval for this evaluation, with Z_{DUP} at or above 1.96, but below 2.58; and
- One Z_{DUP} evaluation result (0.6 percent) exceeded the 99 percent confidence interval for this evaluation, with Z_{DUP} values at or above 2.58.

As with the field duplicates, the Z_{DUP} statistical test predicts that approximately 4 percent of reported Z_{DUP} scores (approximately six Z_{DUP} results in this Z_{DUP} set) will be in the range between 1.96 and 2.58. The five results in that “warning” range are within the expected frequency.

The single exceedance, with a U-238 Z-score of 3.41, is within the expected frequency. Further review of the associated laboratory data indicates that the U-238 exceedance in the rinsate sample is unsupported by the expected corresponding U-234 activity in the same rinsate sample, that an equipment contamination issue is highly unlikely, and that no RTL exceedances are attributable to the sampling equipment. The Z-score exceedance is believed to be a routine statistical excursion.

The evaluation of equipment blank results indicates that the decontamination of the field sampling equipment is acceptable and that there is no evidence of sample cross-contamination from the sampling equipment that would adversely affect the quality or usability of the reported field sample data. A summary of the rinsate and source water blank analytical results are provided in Table A.4.

5.0 CONCLUSIONS

The Round 2 analytical results are documented in this technical memorandum; however, the analytical results have not been screened using the RTLs. Radiological trigger levels were

reference soil concentrations designed to be used as a decision making tool to guide the placement of Round 2 step-out sampling locations. No additional step-out sampling will be conducted as part of the EPA's SSFL Area IV Study; therefore, there is no technical reason to compare the data to RTLs.

The Subarea 6 Round 1 and Round 2 analytical results will be evaluated using Field Action Levels (FAL) established specifically for the SSFL Area IV Radiological Study. The results of the evaluation will be presented in the Radiological Characterization of Soils in Area IV and NBZ report.

Notes:

¹Northing and easting measured using NAD83 SPZ5 US Feet

²Round 1 location resampled during round 2, boring log information contained in round 1 boring logs

bgs - below ground surface

CL - clay

ft - feet

ML - silt

SC - clayey sand

SM - silty sand

SP - poorly graded sand

SW - well graded sand

Notes:

Refer to Table 2.1 of the Final Field Sampling Plan for Soil Sampling (HGL, 2012a) for a definition of radionuclide symbols.

Reporting units in picocuries per gram.

-- Indicates an RTL has not been developed for the analyte.

bgs - below ground surface

MDC - minimum detectable concentration

RTL - radiological trigger level

TPU - total propagated uncertainty

J - The analyte was detected at the reported concentration; the quantitation is an estimate.

K - Analyte present. Reported value may be biased high. Actual value is expected to be lower.

L - Analyte present. Reported value may be biased low. Actual value is expected to be higher.

R - The result is rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria.

S - Analyte result is subject to spectral interference. Unless otherwise qualified, the data is believed to be consistent with the background study results and may be used for its intended purpose.

U - Not considered detected. The associated number is the reported concentration.

UJ - Not considered detected. The associated number is the reported concentration, which may be inaccurate.

Notes:

Refer to Table 2.1 of the Final Field Sampling Plan for Soil Sampling (HGL, 2012a) for a definition of radionuclide symbols.

Reporting units in picocuries per gram.

ID - identification

MDC - minimum detectable concentration

TPU - total propagated uncertainty

J - The analyte was detected at the reported concentration; the quantitation is an estimate.

K - Analyte present. Reported value may be biased high. Actual value is expected to be lower.

S - Analyte result is subject to spectral interference. Unless otherwise qualified, the data is believed to be consistent with the background study results and may be used for its intended purpose.

U - Not considered detected. The associated number is the reported concentration.

Notes:

Refer to Table 2.1 of the Final Field Sampling Plan for Soil Sampling (HGL, 2012a) for a definition of radionuclide symbols.

¹H-3 analyses was only required if it was included in the analytical suite for samples collected that day.

Reporting units in picocuries per liter.

-- - analyte not required/analyzed

MDC - minimum detectable concentration

TPU - total propagated uncertainty

J - The analyte was detected at the reported concentration; the quantitation is an estimate.

U - Not considered detected. The associated number is the reported concentration.

ATTACHMENT 2

Boring Logs

The boring logs are provided in a separate pdf due to size restrictions.
