Calvert Cliffs

Note: The following Staff will be on site upon your arrival:

- Jason Van Buren- Advance
- Judd Swift - Advance
- Frank Celia - Security

Friday, May 25th

- 8:30 AM Media vans depart DOE with Jeanne Lopatto, Joe Davis,
10:00 AM Joe Kelliher, Jeff Salmon, and Bill Magwood en route to
 Calvert Cliffs Nuclear Power Station
- 9:00 AM Depart Abraham residence with Reggie Sellers and Dan
10:30 AM Muniz. Kyle McSlarrow will ride with you to the Nuclear
 Power Plant.
- 10:30 AM Arrive at the Calvert Cliffs Nuclear Power Station
10:37 AM Education Center and begin briefing by station
 management.
 You will be greeted by Christian Poindexter, Chairman and
 CEO of Calvert Cliffs; Charles Cruse, Vice President of
 Nuclear Services; and Larry Weckbaugh, Supervisor of
 Nuclear Services.
 The briefing will cover the following topics: a history of
 Calvert Cliffs, the plant's efforts at environmental
 stewardship, overall plant operation, and on-site spent fuel
 storage.
 Note: Upon your arrival, the press will be pre-set to
 photograph/film your entry into the facility and your
 briefing.
- 10:37 AM Walk from Education Center to the Overlook, where your
10:45 AM briefing will continue. The press will again be pre-
 positioned to photograph your arrival and briefing.
- 10:45 AM Depart Overlook en route to the Education Center.
10:50 AM Note: The press will be departing the overlook early so
 they can arrive at the nuclear facility for check-in.
- 10:50 AM Arrive at the Education Center. You will enter a holding
10:55 AM area while the press completes check-in.

TRIP SCHEDULE FOR SECRETARY ABRAHAM

August 9, 2001

Savannah River, South Carolina

Note: The following staff will greet THE SECRETARY upon his arrival in South Carolina:

Jason Van Buren - Advance

Thursday, August 9th, 2001

7:55 AM THE SECRETARY departs his residence with Reggie
8:15 AM Sellers and Dan Muniz en route to Reagan National Airport.

8:15 AM THE SECRETARY arrives at Reagan National Airport,
8:20 AM where he will be met curbside by Adam Killian and Brice
Cook. A U.S. Air Special Services representative will
escort him to the gate.

8:50 AM Wheels up en route to Columbia, South Carolina

10:25 AM Airline: U.S. Air
Flight # 5859
Seat #: 3A
Flight Time: 1 Hour and 35 Minutes
Aircraft: RJ 135
Meal: None

Manifest / Confirmation Codes

Secretary Abraham / EVHRTN

Jesse Roberson - Assistant Secretary / CICXOR

Joe McMonigle - Senior Staff / IVCVUY

Paul Longworth - Senior Staff / EWSDZJ

Ken Rapuano - Senior Staff / CWHCZM

Joe Davis - Public Affairs / GRCIEN

Alex McGee - Congressional Affairs / HXJIVN

Carlson Wagonlit Travel Emergency: 800-383-6723

10:25 AM THE SECRETARY arrives at Columbia Metro Airport,
10:30 AM where he is met at the gate by Jason Van Buren and a U.S.
Air Special Services representative and escorted to his
vehicle.

10:30 AM THE SECRETARY departs en route to Savannah River
11:55 AM Site (SRS)

UNCLASSIFIED/SENSITIVE

8564

ACTUAL

8/14/2001 9:16 AM

11:55 AM
12:00 PM

THE SECRETARY arrives at SRS, where he will be met by DOE Site Manager Greg Rudy and escorted to the Main Administration Area.

12:00 PM
12:30 PM

THE SECRETARY eats lunch with DOE and SRS senior management officials. During the lunch, he will receive an introductory briefing on SRS, a general overview of site operations and functions, and a visit preview. Following the briefing, THE SECRETARY, DOE HQ staff, DOE SRS staff, and local congressional staff will board a tour bus that will take them to the Tritium Facility.
Location: Building 703-A, Room E-277

12:30 PM
1:00 PM

THE SECRETARY departs en route to the Tritium Facility. While en route, THE SECRETARY will drive by F Canyon and the F-235 facility. Jim Gaver, Savannah's External Affairs Director, will conduct the F-Canyon tour.

Note: An EM facility, F-Canyon (and it's sister facility, H-Canyon) is a large nuclear materials reprocessing facility. Originally constructed to extract plutonium and uranium from defense production reactor fuel, both the F- and H-Canyon facilities are currently used to process and stabilize legacy nuclear wastes and materials. Because of the intense radioactivity of the materials being processed, facility operators must carry out all work remotely using television cameras and robotic arms.

1:00 PM
1:10 PM

THE SECRETARY arrives at the Tritium Facility, where he will be given a tour overview and short briefing on Tritium issues at SRS

1:10 PM
1:40 PM

THE SECRETARY tours the Tritium Facility. Two tours will be provided: one for those with Q clearance and another for those with no clearance. THE SECRETARY'S tour will be led by Wayne Richardson, Tritium Division Director. During his tour, THE SECRETARY will be participate in a demonstration in which he will be asked to cut the stem of a tritium rod by clicking a button on a computer mouse. At the conclusion of the tour, the delegation will re-board the tour bus.

Note: This is a National Nuclear Security Administration / Defense Programs (NNSA/DP) facility that stores, recycles, and packages tritium for use in nuclear warheads. Tritium is an essential component in nuclear weapons and must be replenished continually because it decays at a rate of 5.5

UNCLASSIFIED/SENSITIVE

8565

ACTUAL

8/14/2001 9:16 AM

percent a year. No new tritium is currently being produced in the United States.

1:40 PM
1:50 PM

THE SECRETARY departs en route to Defense Waste Processing Facility (DWPF)

1:50 PM
2:20 PM

THE SECRETARY tours the DWPF facility. The tour will be led by Charlie Anderson, Assistant Manager for High-level Waste. At the conclusion of the tour, THE SECRETARY and his staff will have their hands and feet checked for contamination with a detection wand. The delegation will then re-board the tour bus.

Note: DWPF is an EM facility that converts high-level liquid radioactive wastes, currently stored in large underground storage tanks, into glass canisters. Each canister is 10 feet long and weighs 5,000 pounds and will eventually be sent to the geologic repository along with commercial spent nuclear fuel. Canisters will be stored at the Savannah River Site until the geologic repository is opened. DWPF is also designated to carry out the Plutonium Immobilization project for the NNSA's Fissile Materials Disposition Program.

2:20 PM
2:35 PM

THE SECRETARY departs en route to all-hands meeting with SRS staff

2:35 PM
2:45 PM

Hold time

2:45 PM
3:15 PM

THE SECRETARY holds an all-hands meeting with DOE personnel, contracting staff, and congressional staff. Expected attendance is approximately 390 people.
Location: Building 708-A, Cafeteria

Note: This event will be open to the press. Following THE SECRETARY'S address, there will be five minutes allowed for Q & A with the media. Approximately 10 minutes have been allotted for THE SECRETARY to meet and greet the all-hands attendees.

3:15 PM
3:25 PM

THE SECRETARY departs en route to a meeting with Community Leaders

UNCLASSIFIED/SENSITIVE

8566

ACTUAL

8/14/2001 9:16 AM

3:25 PM
3:55 PM

THE SECRETARY meets with local community leaders
Location: Building 703-41A, Rainbow Room

Note: The Secretary will be introduced by Augusta Mayor Bob Young.

3:55 PM
5:00 PM

THE SECRETARY departs en route to Columbia Airport

5:00 PM
5:10 PM

THE SECRETARY arrives at Columbia Airport, where he will be met by a U.S. Air Special Services representative and escorted to his gate.

5:30 PM
6:59 PM

Wheels up en route to Washington, D.C.

Airline: U.S. Air
Flight #: 5863

Joe,

Attached is another version of the talking points for you. We tightend it up some and added a few more ideas. It still fits on two pages.

Again, all our changes are in red. New changes to this version are in italics... old changes are not in italics.

Trevor.

Subject: RE: "Energy Legislative Agenda"

There was a reference to the NEP recommendation that DOE develop legislation that would "enhance reliability," among other goals.

Joe

Press accounts say the White House sent an "Energy Legislative Agenda" to the Hill last Thursday. What did this agenda say about reliability legislation?

Thanks.
dave

ES - I may not have anything to you on ideas for how to approach a "national grid study" until early next week. We had to do a little scrambling to respond to Mr. DeLay's request to address a draft electricity restructuring bill, as well as a couple of other crash items. FYI, the Reliability Legislation Coalition is meeting today (July 3, 1-4 pm in CEA offices) to discuss what can be done to bring others on board in support of the consensus reliability legislation that is already supported by 14 industry and state organizations. You're welcome to attend.

Subject: NEPDG Long-Term Strategy Meeting - 4:45 TOMORROW

- Andrew Lundquist and Karen Knutson, Director and Deputy Director, respectively, of the National Energy Policy Development Group, have asked that everyone on this list attend a pre-meeting tomorrow, Thursday, June 21, at 4:45 p.m. in the Vice President's Ceremonial Office, 276 OEOP, to discuss long-term strategy with regard to the National Energy Policy.

Following the meeting in the Ceremonial Office, Andrew and Karen are hosting a reception beginning at 5:30 p.m. just down the hall out on Mrs.

Cheney's balcony, room 200 OEOP. You are all invited. The reception is being held in appreciation for all of the hard work that went into the production of the 2001 National Energy Policy report by NEPDG agency and White House staff. Since some of you are new "liaisons" for your respective agencies, this will be a good way for you to meet the people you will be working with on the implementation of the Plan. There will be snacks and plenty of beverages.

Please confirm with me whether or not you'll be able to make the 4:45 tomorrow. If you'll be attending, I'll need your social security # and date of birth in order to clear you into the building. If you have already e-mailed me your info., no need to do so again. Otherwise, please send me your info. as soon as possible.

Thanks. - Kjersten Drager, Assistant to the Director, NEPDG

¹ Nonutility power producers' use of renewable energy to produce electricity and useful thermal output is included in the Industrial sector, not the electric utility sector. Covers facilities of 1 megawatt or greater capacity.

² For Btu conversion rates, see Appendix Table A6.

³ Wood.

⁴ Geothermal heat pump and direct use energy.

⁵ The solar thermal component of 0.06 quadrillion Btu for residential and commercial use is calculated by presuming an overall efficiency of 50 percent for all three categories of solar thermal collectors (low temperature, medium temperature, and high temperature), a 1,500-Btu per square foot average daily insolation, and the potential thermal energy production from the 219 million square feet of solar thermal collectors produced between 1980 and 1999. This is a simplified approach since low-temperature and high-temperature collectors have been rated at more than 50 percent efficient and medium-temperature collectors are generally less than 50 percent efficient. Included also is a very small amount of photovoltaic solar energy.

⁶ Wood, wood waste, black liquor, red liquor, spent sulfite liquor, pitch, wood studge, peat, railroad ties,

utility poles, municipal solid waste, landfill gas, methane, digester gas, liquid acetonitrile waste, tall oil, waste alcohol, medical waste, paper pellets, sludge waste, solid byproducts, tires, agricultural byproducts, closed looped biomass, fish oil, and straw.

⁷ Geothermal electricity generation, heat pump, and direct use energy.

⁸ Hydroelectricity generated by pumped storage is not included in renewable energy.

⁹ Ethanol blended into motor gasoline.

¹⁰ Includes electricity imports from Mexico that are derived from geothermal energy.

¹¹ Includes electricity net imports from Canada that are derived from hydroelectric power.

R=Revised, E=Estimated, (s)=Less than 0.0005 quadrillion Btu.

Note: Totals may not equal sum of components due to independent rounding.

Residential Heating Oil Prices: What Consumers Should know

(5)5

Introduction

Heating oil is a petroleum product used by many Americans to heat their homes. Historically, heating oil prices have fluctuated from year to year and month to month, generally being higher during the winter months when demand is higher. This winter, consumers are even more concerned about the potential for higher prices. To understand the reasons for these price variations, consumers need to understand how heating oil is used and how and where it is produced.

Who uses heating oil?

Of the 101.5 million households in the United States, approximately 7.7 million use heating oil. Residential space heating is the primary use for heating oil, making the demand highly seasonal. Most of the heating oil use occurs during October through March. The area of the country most reliant on heating oil is the Northeast.

Some customers try to beat rising winter prices by filling their storage tanks in the summer or early fall when the prices are likely to be lower. However, most homeowners do not have large enough storage tanks to store the full amount needed to meet winter demands. Because homeowners may have to refill their tanks as often as 4 or 5 times during the heating season, rising or spiking prices are a concern.

Where does heating oil come from?

The United States has two sources of heating oil: domestic refineries and imports from foreign countries. Refineries produce heating oil as a part of the "distillate fuel oil" product family, which includes heating oils and diesel fuel. Distillate products are shipped throughout the United States by pipelines, barges, tankers, trucks and rail cars. Most imports of distillate come from Canada, the Virgin Islands and Venezuela.

Refiners are limited in the amount of heating oil they can make to meet the demands of the winter heating season. Some winter heating oil is produced by refineries in the summer and fall months and stored for winter use. During the coldest winter months, the inventories that are built in summer and fall are used to help meet the high demand. Refiners can increase heating oil production in the winter to a modest degree, but they quickly reach a point where, to produce more heating oil, they would also have to produce more of other petroleum products which could not be sold in sufficient quantities during the winter months. On the other hand, if consumer demand is high for a seasonal product, such as gasoline, refiners may delay producing heating oil for the winter, which may lower inventories at the start of the heating season.

Heating oil is brought into oil storage terminals in an area by refiners and other suppliers. For example, heating oil may be delivered to a central distribution area, such as New York Harbor, where it is then redistributed by barge to other consuming areas, such as New England. Once heating oil is in the consuming area, it is redistributed by truck, to smaller storage tanks closer to a retail dealer's customers, or directly to residential customers.

How much does a gallon of heating oil cost?

Heating oil prices paid by consumers are determined by the cost of crude oil, the cost to produce the product, the cost to market and distribute the product, as well as the profits (sometimes losses) of refiners, wholesalers and dealers. In 1999, crude oil accounted for approximately 48 percent of the cost of a gallon of heating oil. The next largest component of heating oil price (45 percent) included the cost of distribution and marketing. Lastly, refinery processing costs accounted for another 7 percent (Figure 1).

Figure 1. Heating Oil Price Components, 1999

Source: EIA's *Petroleum Marketing Annual, 1999*

Why do heating oil prices fluctuate?

Heating oil prices paid by consumers can vary over time and by where a consumer lives. Prices can change for a variety of reasons. These include:

Seasonality in the demand for heating oil - When crude oil prices are stable, home heating oil prices tend to gradually rise in the winter months when demand is highest. However, at times, prices can surge quickly to very high levels, as occurred in January/February 2000 (see box on "What Causes a Surge in Heating Oil Prices"). A homeowner in the Northeast might use 650-1,000 gallons of heating oil during a typical winter, while consuming very little during the rest of the year.

Changes in the cost of crude oil - Since crude oil is a major price component of heating oil, changes in the price of crude oil will generally affect the price of heating oil (Figure 2). Crude oil prices are determined by worldwide supply and demand. Demand can vary worldwide with the economy and with weather. Supply can be influenced by the Organization of Petroleum Exporting Countries (OPEC) and other factors.

Figure 2. Heating Oil Prices Follow Crude Oil

Source: DJI Platt's Spot Prices, EIA Petroleum Marketing Monthly, 1986 - Present

Competition in local markets - Competitive differences can be substantial between a locality with only one or a few suppliers or dealers versus an area with a large number of competitors. Consumers in remote or rural locations may face higher prices because there are fewer competitors.

Regional operating costs - Prices also are impacted by higher costs of transporting the product to locations. In addition, the cost of doing business by dealers can vary substantially depending on the area of the country in which the dealer is located. Costs of doing business include wages and salaries, benefits, equipment, lease/rent, insurance, overhead, and state and local fees.

Heating Oil is Important to Consumers in the Northeast

Of the 7.7 million households in the United States that use heating oil to heat their homes, 5.3 million households or roughly 69 percent reside in the Northeast region of the country. The Northeast region (which includes the New England and Central Atlantic States) remains the area with an appreciable share of oil-heated single family homes. In other regions, older homes have been converted from oil heat to gas heat, and oil no longer has a noticeable share of the new home construction market. Thus, the seasonal increase in inventories and demand (sales of heating oil) is largely confined to the Northeast. In 1999, 4.9 billion gallons of heating oil were sold to residential consumers in the Northeast; this is 78 percent of total U. S. residential fuel oil sales (Figure 3).

Figure 3. Residential Heating Oil Sales by Region

Source: EIA Fuel Oil and Kerosene Sales, 1999.
Note: Gulf Coast Sales too small to display.

What Causes a Surge in Heating Oil Prices?

Home heating oil prices sometimes can change dramatically in a short period of time. Why does this happen? If refiners, wholesalers, dealers and consumers have enough heating oil in storage and temperatures do not drop rapidly, prices hold fairly steady (assuming crude oil prices are also not changing much). However, a rapid change to colder weather can impact both supply and demand; people want more fuel at the same time that harbors and rivers are frozen or delivery systems are interrupted. During this time, the available heating oil in storage is used much faster than it can be replenished. Refineries normally cannot keep up with demand during these cold periods. Wholesale buyers become concerned that supplies are not adequate to cover short-term customer demand and bid up prices for available product. In the Northeast, for example, additional supplies may have to come from some distance away such as the Gulf Coast or Europe. It costs more to transport heating oil from these sources to the Northeast, and it also can take two to three weeks to arrive. During the time that resupply from distant markets is occurring, the supply of heating oil that sellers in the region have in storage drops further, buyers' anxiety about finding heating oil in the short term rises, and so do prices – sometimes sharply – until new supplies arrive.

Additionally, during very cold periods, prices of other heating fuels (such as natural gas or kerosene) may increase even more than heating oil. In this case, some consumers may switch from using their normal heating fuel to using heating oil, thereby increasing the demand for heating oil.

What can you do to lower your heating oil bill?

You can arrange to have your tank filled in late summer or early fall when prices are generally lower.

Talk to your heating oil dealer about participating in a budget plan to help stabilize your monthly bill.

You can also talk to your heating oil dealer about “cap” or fixed price protection programs, which can help keep costs down. You can obtain a home energy audit to ensure that your furnace and appliances are running efficiently before the season begins. You can achieve conservation gains by weatherizing your home, i.e., installing the proper insulation in your house and around your hot water heater. Quick and easy fixes such as caulking and weather stripping windows and doors to seal out cold air also help save energy. Installing a programmable thermostat and reducing temperature settings on your thermostat, especially when you are not at home, are other ways to reduce your heating fuel costs.

Lastly, energy assistance programs are available to heating oil customers who have a limited budget. For example, the Low Income Home Energy Assistance Program (LIHEAP) is a Federal program that distributes funds to States to help low-income households pay heating bills. Additional State energy assistance and fuel fund programs may be available to help households during a winter emergency. To find out if you qualify for assistance in your State, see:

www.acf.dhhs.gov/programs/liheap/states.htm

or contact your local heating oil dealer.

Information about heating oil prices...

For the latest update on heating oil demand, prices, and inventories, see our “Heating Oil and Propane Update” section of the web site at:

Energy in the United States: A Brief History and Current Trends

Energy is essential to life. Living creatures draw on energy flowing through the environment and convert it to forms they can use. The most fundamental energy flow for living creatures is the energy of sunlight, and the most important conversion is the act of biological primary production, in which plants and sea-dwelling phytoplankton convert sunlight into biomass by photosynthesis. The Earth's web of life, including human beings, rests on this foundation.

Over millennia, humans have found ways to extend and expand their energy harvest, first by harnessing draft animals and later by inventing machines to tap the power of wind and water. The watershed social and economic development of the modern world, industrialization, was accompanied by the widespread and intensive use of fossil fuels. This development freed human society from the limitations of natural energy flows by unlocking the Earth's vast stores of coal, oil, and natural gas. By tapping these ancient, concentrated deposits of solar energy, the rate at which energy could be poured into the human economy was enormously multiplied.

The result was one of the most profound social transformations in history. The new river of energy wrought astonishing changes and did so with unprecedented speed. The energy transformations experienced by traditional societies—from human labor alone to animal muscle power and later windmills and watermills—were very slow, and their consequences were equally slow to take effect. In contrast, industrialization and its associated socioeconomic changes took place in the space of a few generations.

The history of energy use in the United States reflects these general themes of transformation and its consequences. Consider the evolution of the U.S. energy mix. Wood energy has been a significant part of that mix for a very long time (Figure 1); in fact, fuelwood was overwhelmingly the dominant energy source from the founding of the earliest colonies until late in the last century. Thereafter, the modern era is notable for the accelerated appearance of new sources of energy, in contrast to the imperceptible pace of change in earlier times. Coal ended the long dominance of fuelwood in the United States about 1885, only itself to be surpassed, in 1951 by petroleum and then

Figure 1. Energy Consumption in the United States, 1775-1999

(19)

by natural gas a few years later. Hydroelectric power and nuclear electric power appeared about 1890 and 1957, respectively. Solar photovoltaic, advanced solar thermal, and geothermal technologies also represent recent developments in energy sources. The most striking of these entrances, however, is that of petroleum and natural gas. The curves depicting their consumption remain shallow for several decades following the haphazard success of Colonel Drake's drilling rig in 1859, but begin to rise more steeply in the 1920s. Then, interrupted only by the Depression, the curves climb at increasingly alpine angles until 1973. Annual consumption of petroleum and natural gas exceeded that of coal in 1947 and then quadrupled in a single generation. Neither before nor since has any source of energy become so dominant so quickly.

As for the social, economic, and ecological consequences of evolving energy sources, they are too deep and numerous to do more than give suggestive examples. One of the most significant is the shift between muscle- and machine power. Horses, mules, and other draft animals were invaluable prime movers well into the first half of the 20th century, and despite increasing reliance on fossil fuels and the engines they powered, the number of draft animals in the United States continued to rise until about 1920. As late as 1870, draft animals accounted for more than half of the total horsepower of all prime movers. Their displacement by fossil-fuel driven engines meant, eventually, the disappearance from city and farm alike of millions of animals, along with the vast stables that housed the city-based animals, the mountains of dung they left on city streets, and the hordes of English sparrows that fed on the grain therein.

As fossil fuels and the machines that ran on them proliferated, the nature of work itself was transformed along with the fundamental social, political, and geopolitical circumstances of the Nation. In the middle of the 19th century, most Americans lived in the countryside and worked on farms. The country ran mainly on wood fuel and was relatively unimportant in global affairs. A hundred years later, after the Nation had become the world's largest producer and consumer of fossil fuels, most Americans were city-dwellers and only a relative handful were agricultural workers. The United States had roughly tripled its per-capita consumption of energy and become a global superpower.

Although coal, oil, and natural gas are the world's most important energy sources, their dominance does not extend to all corners of the globe. In most places and times diversity and evolution in energy supplies has been the rule. In many areas muscle power and biomass energy remain indispensable. The

shifting emphasis over time is clear not only in the long sweep of history but also in the short term, especially in the industrialized world. Electricity, for example, was essentially unavailable until the 1880s; now it is ubiquitous. And as the data in this volume show, in the span of a few decades nuclear electric power in the United States was born, peaked, and began to decline in its contribution to total energy production.

No doubt we have not seen the end of evolution in energy sources. The pages that follow briefly discuss the major energy sources now in use in the United States, including a bit of history, trends, and snapshots of current consumption. The story they tell is one of diversity and transformation, driven by chance, the play of economic forces, and human ingenuity. Whatever energy future awaits us, that part of the story seems unlikely to change.

Total Energy

The United States has always been a resource-rich nation, but in 1776, the year the Nation declared its independence from Great Britain, nearly all energy was still supplied by muscle power and fuelwood. America's vast deposits of coal and petroleum lay untapped and mostly undiscovered, although small amounts of coal were used to make coke, vital for casting the cannon that helped win the war. Mills made use of waterpower, and of course the wind enabled transport by ship.

Fuelwood use continued to expand in parallel with the Nation's economic growth, but chronic shortages of energy in general encouraged the search for other sources. During the first 30 years or so of the 19th century, coal began to be used in blast furnaces and in making coal-gas for illumination. Natural gas also found limited application in lighting during the period. Even electricity sought a niche; for example, experiments were conducted with battery-powered electric trains in the 1840s and 1850s. Still, muscle power remained an important source of energy for decades. Although a number of mechanical innovations appeared, including the cotton gin and the mechanical reaper, they had the effect of multiplying the productivity of human and animal muscle power rather than spurring the development of machine power. It was not until well after mid-century that the total work output from all types of engines exceeded that of work animals.

The westward expansion helped change that. As railroads drove west to the plains and the mountains, they left behind the fuelwood so abundant along the eastern seaboard. Coal became more attractive, both because deposits were often found near the new railroad rights of way and because its

higher energy content increased the range and load of steam trains. Demand for coal also rose because the railroads were laying thousands of miles of new track, and the metals industry needed an economical source of coke to make iron and steel for the rails and spikes. The transportation and industrial sectors in general began to grow rapidly during the latter half of the century, and coal helped fuel their growth.

Petroleum got its start as an illuminant and nostrum ingredient and did not catch on as a fuel for some time. At the end of World War I, coal still accounted for about 75 percent of U.S. total energy use. About the same time, the horse and mule population reached 26 million and then went into permanent decline. The beginning of the transition from muscle power was over.

America's appetite for energy as it industrialized was prodigious, roughly quadrupling between 1880 and 1918. Coal fed much of this growth, while electricity expanded in applications and total use alike. Petroleum got major boosts with the discovery of Texas's vast Spindletop Oil Field in 1901 and with the advent of mass-produced automobiles, several million of which had been built by 1918.

In the years after World War II, "Old King Coal" relinquished its place as the premier fuel in the United States. The railroads lost business to trucks that ran on petroleum and also began switching to diesel locomotives themselves. Labor troubles and safety standards drove up coal production costs. The declining demand for natural gas as an illuminant forced that industry to look for other markets. Heating applications had obvious potential, and natural gas replaced coal in many household ranges and furnaces. The coal industry survived in part because nationwide electrification created new demand for coal among electric utilities despite regional competition from hydroelectric and petroleum-fired generation.

Most energy produced today in the United States, as in the rest of the industrialized world, comes from fossil fuels—coal, natural gas, crude oil, and natural gas plant liquids (Figure 2). Although U.S. energy production draws from many sources, fossil fuels together far exceed all other forms. In 1999 they accounted for 80 percent of total energy production and were valued at an estimated \$94 billion (nominal dollars).

For much of its history, the United States was mostly self-sufficient in energy, although small amounts of coal were imported from Britain in colonial times. Through the late 1950s, production and consumption of energy

Figure 2. Energy Production, 1999

were nearly in balance. Over the following decade, however, consumption slightly outpaced domestic production and by the early 1970s a more significant gap had developed (Figure 3).

Figure 3. Production and Consumption

In 1999 the United States produced 73 quadrillion British thermal units (Btu) of energy and exported 4 quadrillion Btu, about 40 percent of it as coal. Consumption totaled 97 quadrillion Btu, requiring imports of 27 quadrillion Btu (Figure 4), 18 times the 1949 level.

This appetite for imported energy is driven by petroleum consumption. U.S. petroleum imports in 1973 totaled 6.3 million barrels per day (3.2 million barrels per day of crude oil and 3.0 million barrels per day of petroleum products). In October 1973, however, the Arab members of the Organization of Petroleum Exporting Countries (OPEC) embargoed the sale of oil to the United States, prices rose sharply, and petroleum imports fell for two years (Figure 5). They increased again until the price of crude oil rose dramatically (roughly 1979 through 1981) and suppressed imports. The rising-import trend resumed by 1986, and in 1998 U.S. petroleum net imports reached an annual record level of 9.8 million barrels per day. In 1999, net imports fell slightly to 9.6 million barrels per day.

The efficiency with which Americans use energy has improved over the years. One such measure is the amount of energy consumed to produce a (constant) dollar's worth of gross domestic product (GDP). By that measure, efficiency improved 47 percent between 1949 and 1999, as the amount of energy required to generate a dollar of output (chained 1996 dollars) fell from 20.6 thousand Btu to 10.9 thousand Btu. Nevertheless, a growing

Figure 4. Energy Flow, 1999
(Quadrillion Btu)

Figure 5. Petroleum Trade

population and economy drove total energy use up. As the U.S. population expanded from 149 million people in 1949 to 273 million in 1999 (an increase of 83 percent), total energy consumption grew from 32 quadrillion Btu to 97 quadrillion Btu (up 202 percent). Per-capita energy consumption rose 65 percent, from 215 million Btu in 1949 to 354 million Btu in 1999.

Energy plays a central role in the operation of the industrialized U.S. economy, and energy spending is commensurately large. In recent years, American consumers have spent over half a trillion dollars a year on energy. That energy is consumed in three broad end-use sectors: the residential and commercial sector, the industrial sector, and the transportation sector. Industry, historically the largest consuming sector of the economy, ran just ahead of the residential and commercial sector in recent years, followed by the transportation sector (Figure 6).

The industrial sector reveals occasional sharp fluctuations in its use of energy. In contrast, trends in the residential and commercial sector are smoother. Within the sectors, energy sources have changed dramatically over time. For example, in the residential and commercial sector, coal was the leading source as late as 1951 but disappeared rapidly thereafter (Figure 7). Petroleum usage grew slowly to its peak in 1972 and then subsided. Natural gas became an important resource, growing strongly until 1972, when its growth stalled. Electricity, only an incidental source in 1949, expanded in almost every year since

8972

Figure 6. Energy Consumption by End-Use Sector

then, as did the energy losses associated with producing and distributing the electricity. (See page xxxi for an explanation of these losses.)

The expansion of electricity use reflects the increased electrification of U.S. households, which typically rely on a wide variety of electrical

Figure 7. Residential and Commercial Consumption

appliances and systems. In 1997, 99 percent of U.S. households had a color television and 47 percent had central air conditioning. Eighty-five percent of all households had one refrigerator; the remaining 15 percent had two or more. New products continued to penetrate the market; for example, in 1978 only 8 percent of U.S. households had a microwave oven, but by 1997 microwaves could be found in 83 percent. EIA first collected household survey data on personal computers in 1990, when 16 percent of households owned one or more. By 1997 that share had more than doubled to 35 percent.

U.S. home heating also underwent a big change. Over a third of all U.S. housing units were warmed by coal in 1950, but by 1997 that share was only 0.2 percent. Distillate fuel oil lost just over half its share of the home-heating market during the same period, falling from 22 percent. Natural gas and electricity gained as home-heating sources: the share of natural gas rose from about a quarter of all homes to over half, while electricity's share shot up from only 0.6 percent in 1950 to 29 percent in 1997. In recent times, electricity and natural gas have been the most common sources of energy used by commercial buildings as well.

In the industrial sector, the consumption of both natural gas and petroleum rose steadily and in tandem until the oil embargo in 1973, after which their use fluctuated (Figure 8). Consumption of coal, once the leading source in the sector, shrank. Electricity and its associated losses grew steadily.

About three-fifths of the energy consumed in the industrial sector is used for manufacturing. The remainder goes to mining, construction, agriculture, fisheries, and forestry. Within manufacturing, large consumers of energy are the petroleum and coal products, chemicals and allied products, paper and allied products, and primary metal industries. Natural gas is the most commonly consumed energy source in manufacturing. The predominant end-use activity is process heating, followed by machine drive and then facility heating, ventilation, and air conditioning combined.

Just under 7 percent of all energy consumed in the United States is used for nonfuel purposes, such as asphalt and road oil for roofing products and road building and conditioning; liquefied petroleum gases for feedstocks at petrochemical plants; waxes for packaging, cosmetics, pharmaceuticals, inks, and adhesives; and still gas for chemical and rubber manufacture.

Figure 8. Industrial Consumption

While variety and change in energy sources are the hallmarks of the industrial sector and the residential and commercial sector, transportation's reliance on petroleum has been nearly total since 1949 (Figure 9).

Figure 9. Transportation Consumption

Figure 10. Motor Vehicle Efficiency

Compared with trends just prior to the oil embargo of 1973, fuel consumption per motor vehicle fell in the two decades that followed, miles traveled per vehicle generally fell until the early 1980s and then resumed a pattern of increase, and the fuel rate (i.e., miles per gallon) improved greatly (Figure 10).

Petroleum

It is hard to imagine a world without petroleum, partly because humans have been using it since at least 3000 B.C. Mesopotamians of that era used "rock oil" in architectural adhesives, ship caulks, medicines, and roads. The Chinese of two millennia ago refined crude oil for use in lamps and in heating homes. Seventh-century Arab and Persian chemists discovered that petroleum's lighter elements could be mixed with quicklime to make "Greek fire," the napalm of its day. From these scattered uses, petroleum has come to occupy a central place in modern civilization. Today petroleum still finds applications in buildings, shipping, medicine, roads, and warfare. It is crucial to many industries, including chemicals and agriculture. Needless to say, it dominates the world energy scene.

Petroleum was known to native peoples in the northeastern parts of what was to become the United States, and was put to various uses by some of
