

Dear President Joe Biden, dear Secretary Granholm,

We, civil society organizations from across Europe with a deep understanding of the EU gas system, welcome your Administration's potential decision to halt further expansion of US LNG export capacity and the possible ruling to subject LNG facility build-out to a comprehensive climate and human rights/public interest assessment.

We firmly reject the notion that further US LNG build-out would be necessary to serve Europe's energy security and lament the fact this specious argument is still being peddled by the fossil fuel industry.

Measures taken by European policymakers since Russia's invasion of Ukraine, both from a supply and demand perspective, have already allayed concerns around the continent's future gas requirements. EU countries managed to reduce their gas demand by 19% from the time of the invasion to January 2023¹, while a host of new LNG import terminals were added across the 27-nation bloc.

Research shows that even in the case of a cold winter combined with a total halt on Russian LNG, Europe would be able to maintain comfortably high levels of gas storage until the end of winter². In other words, **Europe's existing gas supply network is sufficient taking into account both its own import infrastructure and US LNG export infrastructure.**

Indeed, energy market observers now believe Europe's build out of new LNG import infrastructure may already have gone too far. Average utilisation rates at Europe's existing LNG terminals stood at just 60% in 2023³, so questions are being raised about the need for these additional terminals, especially with Europe's gas demand set to decline over the course of the decade.

Several EU-level policies, such as the EU Climate Law or the RePowerEU communication, include requirements for a significant, structural reduction of gas demand. Combined clean energy measures in RePowerEU could result in a decrease of as much as over 50% of the EU gas demand by 2030⁴. Gas demand reduction will be key to comply with EU climate commitments and climate legislation.

President Biden has recognized that climate change is an 'existential threat' to humanity yet current plans for expansion of LNG in the United States will contribute to that existential threat. LNG is a particularly polluting fossil fuel, though our use of all fossil fuels must end. Research finds that methane emissions and energy needed along the supply chain of U.S. LNG leads to a

climate impact of LNG higher or even considerably higher than that even of coal⁵. **LNG capacity expansion is more than at odds with protecting the vital 1.5°C limit set by the Paris Agreement⁶.**

LNG has also been identified and listed by Europe's largest gas consumer Germany as a commodity with potential human rights risks in the supply chain, including in the United States - a significant issue which needs to be addressed by energy companies related to their supply chain.⁷

In this context, we strongly urge you to decide for a stop of the LNG build-out, and to do your utmost to support truly clean energy solutions that serve the people and not fossil fuel interests. The wellbeing of communities all across the planet and our global climate depends on your leadership and fast action to get off fossil fuels. A strong signal on stopping LNG expansion on both sides of the Atlantic would be a first, needed step.

Sincerely,

On behalf of
