General Comment

The increased exporting of LNG by sabine pass Liquefaction would be a constant active exploitation of natural gas, of course this will correlate to leakages and emission of gas into the atmosphere, with the knowledge that we are trying to mitigate the emissions of green house gases regulations should be put in place to effectively control the production or exploitation of LNG by Sabine Pass Liquefaction LLC. The monetary benefit of having to export to other countries is commendable but that should be secondary, the primary objective is to look at how their activities could degrade the ecosystem or environment, how they plan on exploiting or producing the natural gas, how they plan on moving such quantity of gas. In totality a proper environmental impact assessment should be carried out before their application is granted and constant regulatory inspections should be implemented.
